

# Operation **Manual**

## **Goodrive350A Series** **High-performance** **Multifunction VFD**

**SHENZHEN INVT ELECTRIC CO., LTD.**

## Preface

Thank you for choosing Goodrive350A series variable-frequency drive (VFD).

If not otherwise specified in this manual, the VFD always indicates Goodrive350A series VFD, which is a high-performance multifunctional VFD that can drive both synchronous motors (SMs) and asynchronous motors (AMs) and supports torque control, speed control, and position control. The VFD is armed with advanced vector control technology and the latest digital processor dedicated for motor control, thus enhancing product reliability and adaptability to the environment. The VFD adopts customized and industrialized design to realize excellent control performance through optimized functions and flexible applications.

In order to meet diversified customer demands, the VFD provides abundant expansion cards including programmable expansion card, PG card, communication card and I/O expansion card to achieve various functions as needed. Each VFD can be installed with three expansion cards at most.

The programmable expansion card adopts the mainstream development environment for customers to carry out secondary development easily, fulfilling varied customized needs and reducing customer cost.

The PG card supports a variety of encoders like incremental encoders and resolver-type encoders. In addition, it also supports pulse reference and frequency-division output. The PG card adopts digital filter technology to improve EMC performance and to realize stable transmission of the encoder signal over a long distance. It is equipped with encoder offline detection function to contain the impact of system faults.

The VFD supports multiple kinds of popular communication modes to realize complicated system solutions. It can be connected to the internet with optional wireless communication card, by which you can monitor the VFD state anywhere any time through mobile App.

The VFD uses high power density design. Some power ranges carry built-in DC reactor and braking unit to save installation space. Through overall EMC design, it can satisfy the low noise and low electromagnetic interference requirements to cope with challenging grid, temperature, humidity and dust conditions, thus greatly improving product reliability.

This operation manual presents installation wiring, parameter setup, fault diagnosis and trouble shooting, and precautions related to daily maintenance. Read through this manual carefully before installation to ensure the VFD is installed and operated in a proper manner to give full play to its excellent performance and powerful functions.

If the product is ultimately used for military affairs or manufacture of weapon, it will be listed on the export control formulated by Foreign Trade Law of the People's Republic of China. Rigorous review and necessary export formalities are needed when exported.

We reserve the right to update the manual information without prior notice and have the final interpretation for the manual content.

# 1 Safety precautions

## 1.1 What this chapter contains

Read this manual carefully and follow all safety precautions before moving, installing, operating and servicing the VFD. If these safety precautions are ignored, physical injury or death may occur, or damage may occur to the equipment.

If any physical injury or death or damage to the equipment occur due to neglect of the safety precautions in the manual, our company will not be responsible for any damages and we are not legally bound in any manner.

## 1.2 Safety definition

**Danger:** Severe personal injury or even death can result if related requirements are not followed.

**Warning:** Personal injury or equipment damage can result if related requirements are not followed.

**Note:** Actions taken to ensure proper running.

**Trained and qualified professionals:** People working on the VFD must have received professional electrical and safety training and obtained the certificates, and must be familiar with all steps and requirements of VFD installing, commissioning, running and maintaining and capable to prevent any emergencies.

## 1.3 Warning symbols

Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advice on how to avoid the danger. Following warning symbols are used in this manual.

| Symbols                                                                                     | Name                    | Instruction                                                                                                                                        | Abbreviation                                                                              |
|---------------------------------------------------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
|  Danger   | Danger                  | Serious physical injury or even death may occur if related requirements are not followed                                                           |         |
|  Warning | Warning                 | Physical injury or damage to the equipment may occur if related requirements are not followed                                                      |        |
|  Forbid  | Electrostatic discharge | The PCBA may be damaged if related requirements are not followed                                                                                   |        |
|  Hot     | Hot sides               | The VFD base may become hot. Do not touch.                                                                                                         |        |
|  5 min   | Electric shock          | As high voltage still presents in the bus capacitor after power off, wait for at least five minutes (or 15 min / 25 min, depending on the warning) |  5 min |

| Symbols                                                                           | Name        | Instruction                                                       | Abbreviation                                                                      |
|-----------------------------------------------------------------------------------|-------------|-------------------------------------------------------------------|-----------------------------------------------------------------------------------|
|                                                                                   |             | symbols on the machine) after power off to prevent electric shock |                                                                                   |
|  | Read manual | Read the operation manual before operating on the equipment       |  |
| <b>Note</b>                                                                       | Note        | Actions taken to ensure proper operation                          | <b>Note</b>                                                                       |

## 1.4 Safety guidelines

|    | <ul style="list-style-type: none"><li>◇ Only trained and qualified electricians are allowed to carry out related operations.</li><li>◇ Do not perform wiring, inspection or component replacement when power supply is applied. Ensure all the input power supplies are disconnected before wiring and inspection, and wait for at least the time designated on the VFD or until the DC bus voltage is less than 36V. The minimum waiting time is listed in the table below.</li></ul> <table border="1"><thead><tr><th>VFD model</th><th>Minimum waiting time</th></tr></thead><tbody><tr><td>1R5G/2R2P–110G/132P</td><td>5 min</td></tr><tr><td>132G/160P–315G/355P</td><td>15 min</td></tr><tr><td>355G/400P and higher</td><td>25 min</td></tr></tbody></table> | VFD model | Minimum waiting time | 1R5G/2R2P–110G/132P | 5 min | 132G/160P–315G/355P | 15 min | 355G/400P and higher | 25 min |

### 1.4.1 Delivery and installation

|                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>Install the VFD on fire-retardant material and keep the VFD away from combustible materials.</li> <li>Connect the optional braking parts (braking resistors, braking units or feedback units) according to the wiring diagram.</li> <li>Do not operate on a damaged or incomplete VFD.</li> <li>Do not touch the VFD with wet items or body parts; otherwise, electric shock may occur.</li> </ul> |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Note:

- Select appropriate tools for delivery and installation to ensure a safe and proper running of the VFD and avoid physical injury or death. To ensure physical safety, the installation staff should

take mechanical protective measures like wearing safety shoes and working uniforms

- ✧ Protect the VFD against physical shock or vibration during delivery and installation.
- ✧ Do not carry the VFD by its front cover only as the cover may fall off.
- ✧ The installation site must be away from children and other public places.
- ✧ When the installation site altitude exceeds 1000m, derate by 1% for every increase of 100m; when the installation site altitude exceeds 3000m, consult local INVT dealer or office.
- ✧ Use the VFD in proper environment. (For details, see "Installation environment".)
- ✧ Prevent the screws, cables and other conductive parts from falling into the VFD.
- ✧ As leakage current of the VFD during running may exceed 3.5mA, ground properly and ensure the grounding resistance is less than 10Ω. The conductivity of PE grounding conductor is the same as that of the phase conductor (with the same cross sectional area).
- ✧ R, S and T are the power input terminals, and U, V and W are output motor terminals. Connect the input power cables and motor cables properly; otherwise, damage to the VFD may occur.

#### 1.4.2 Commissioning and running

- ✧ Disconnect all power sources applied to the VFD before terminal wiring, and wait for at least the time designated on the VFD after disconnecting the power sources.
- ✧ High voltage presents inside the VFD during running. Do not carry out any operation on the VFD during running except for keypad setup. For products at voltage levels of 5 or 6, the control terminals form extra-low voltage circuits. Therefore, you need to prevent the control terminals from connecting to accessible terminals of other devices.
- ✧ The VFD may start up by itself when P01.21=1. Do not get close to the VFD and motor.
- ✧ The VFD cannot be used as "Emergency-stop device".
- ✧ The VFD cannot act as an emergency brake for the motor; it is a must to install mechanical brake device.
- ✧ During driving a permanent magnet SM, besides above-mentioned items, the following work must be done before installation and maintenance:
  - a) Disconnect all the input power sources including main power and control power.
  - b) Ensure the permanent-magnet SM has been stopped, and the voltage on output end of the VFD is lower than 36V.
  - c) After the permanent-magnet SM is stopped, wait for at least the time designated on the VFD, and ensure the voltage between + and - is lower than 36V.
  - d) During operation, it is a must to ensure the permanent-magnet SM cannot

|  |                                                                                                                                                                                                |
|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | run again by the action of external load; it is recommended to install effective external brake device or disconnect the direct electrical connection between permanent-magnet SM and the VFD. |
|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note:**

- ✧ Do not switch on or switch off input power sources of the VFD frequently.
- ✧ If the VFD has been stored for a long time without being used, set the capacitance (see "Maintenance" and carry out inspection and pilot run on the VFD before use.
- ✧ Close the front cover before running; otherwise, electric shock may occur.

**1.4.3 Maintenance and component replacement**

|                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>✧ Only trained and qualified professionals are allowed to perform maintenance, inspection, and component replacement on the VFD.</li> <li>✧ Disconnect all the power sources applied to the VFD before terminal wiring, and wait for at least the time designated on the VFD after disconnecting the power sources.</li> <li>✧ Take measures to prevent screws, cables and other conductive matters from falling into the VFD during maintenance and component replacement.</li> </ul> |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Note:**

- ✧ Use proper torque to tighten the screws.
- ✧ Keep the VFD and its parts and components away from combustible materials during maintenance and component replacement.
- ✧ Do not carry out insulation voltage-endurance test on the VFD, or measure the control circuits of the VFD with megameter.
- ✧ Take proper anti-static measures on the VFD and its internal parts during maintenance and component replacement.

**1.4.4 What to do after scrapping**

|                                                                                     |                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ✧ The heavy metals inside the VFD should be treated as industrial effluent.                                                                                                         |
|  | ✧ When the life cycle ends, the product should enter the recycling system. Dispose of it separately at an appropriate collection point but not place it in the normal waste stream. |

## 2 Quick startup

### 2.1 What this chapter contains

This chapter introduces the basic installation and commissioning rules that you need to follow to realize quick installation and commissioning.

### 2.2 Unpacking inspection

Check the following after receiving the product.

|                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ● Whether the packing box is damaged or dampened.                                                                                                        |
| ● Whether the model identifier on the exterior surface of the packing box is consistent with the purchased model.                                        |
| ● Whether the interior surface of the packing box is abnormal, for example, in wet condition, or whether the enclosure of the VFD is damaged or cracked. |
| ● Whether the VFD nameplate is consistent with the model identifier on the exterior surface of the packing box.                                          |
| ● Whether the accessories (including the manual and keypad) inside the packing box are complete.                                                         |

If any problems are found, contact the local dealer or INVT office.

### 2.3 Checking before applying

Check the following before applying the VFD.

|                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------|
| ● Check the load type to verify that there is no overload of the VFD during work and check whether the power class of the VFD needs to be increased. |
| ● Check whether the actual running current of the motor is less than the rated current of the VFD.                                                   |
| ● Check whether the control accuracy required by the load is the same of the VFD.                                                                    |
| ● Check whether the grid voltage is consistent with the rated voltage of the VFD.                                                                    |
| ● Check whether expansion card are needed for selected functions.                                                                                    |

### 2.4 Environment

Check the following before the actual installation and use:

**Note:** For a cabinet-built VFD, the ambient temperature is the air temperature inside the cabinet.

|                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ● Check whether the ambient temperature of the VFD exceeds 40°C. If it exceeds 40°C, derate 1% for every increase of 1°C. It is not recommended to use the VFD if the ambient temperature exceeds 50°C. |
| ● Check whether the ambient temperature of the VFD in actual use is lower than -10°C. If yes, use heating facilities.                                                                                   |
| ● When the altitude exceeds 1000m, derate by 1% for every increase of 100m. When the altitude exceeds 2000m, configure an isolation transformer at the VFD input end. It is not                         |

|                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| recommended that the VFD be used at the altitude higher than 5000m.                                                                                                                                                        |
| <ul style="list-style-type: none"> <li>● Check whether the humidity of the actual usage site exceeds 90% and condensation occurs. If yes, take additional protective measures.</li> </ul>                                  |
| <ul style="list-style-type: none"> <li>● Check whether the actual use site may be exposed to direct sunlight or may have the chance of ingress of foreign objects. If yes, take additional protective measures.</li> </ul> |
| <ul style="list-style-type: none"> <li>● Check whether there is dust, explosive gas, or flammable gas in the actual use site. If yes, take additional protective measures.</li> </ul>                                      |

## 2.5 Installation confirmation

Check the following after the VFD installation:

|                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>● Check whether the load ranges of the input power cable and motor cable meet the actual load requirement.</li> </ul>                                                                                                                                                                                                   |
| <ul style="list-style-type: none"> <li>● Check whether correct accessories are selected for the VFD, the accessories are correctly and properly installed, and the installation cables meet the requirements of all components (including the reactor, input filter, output reactor, output filter, DC reactor, braking unit and braking resistor).</li> </ul> |
| <ul style="list-style-type: none"> <li>● Check whether the VFD is installed on non-flammable materials and the heat-radiating accessories (such as the reactor) are away from flammable materials.</li> </ul>                                                                                                                                                  |
| <ul style="list-style-type: none"> <li>● Check whether all control cables and power cables are run separately and the routing complies with EMC requirement.</li> </ul>                                                                                                                                                                                        |
| <ul style="list-style-type: none"> <li>● Check whether all grounding systems are properly grounded according to the requirements of the VFD.</li> </ul>                                                                                                                                                                                                        |
| <ul style="list-style-type: none"> <li>● Check whether all the installation clearances of the VFD meet the requirements in the operation manual.</li> </ul>                                                                                                                                                                                                    |
| <ul style="list-style-type: none"> <li>● Check whether the installation conforms to the instructions in the operation manual. It is recommended that the VFD be installed uprightly.</li> </ul>                                                                                                                                                                |
| <ul style="list-style-type: none"> <li>● Check whether the external connection terminals of the VFD are tightly fastened and the torque is appropriate.</li> </ul>                                                                                                                                                                                             |
| <ul style="list-style-type: none"> <li>● Check whether there are screws, cables, or other conductive items left in the VFD. If yes, get them out.</li> </ul>                                                                                                                                                                                                   |

## 2.6 Basic commissioning

Complete the basic commissioning as follows before the actual use of the VFD:

|                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>● According to the actual motor parameters, select the motor type, set motor parameters, and select the VFD control mode.</li> </ul>                                             |
| <ul style="list-style-type: none"> <li>● Autotune. If possible, de-couple the VFD from the motor load to start dynamic autotuning. If the VFD cannot be de-coupled from the load, perform static autotuning.</li> </ul> |
| <ul style="list-style-type: none"> <li>● Adjust the ACC/DEC time according to the actual work condition of the load.</li> </ul>                                                                                         |
| <ul style="list-style-type: none"> <li>● Perform device commissioning by means of jogging and check whether the motor rotational</li> </ul>                                                                             |

direction is correct. If not, change the rotation direction by swapping any two phase wires of the motor.

- Set all control parameters and then operate.

## **3 Product overview**

### **3.1 What this chapter contains**

This chapter mainly introduces the operation principles, product features, layouts, nameplates and model designation rules.

### **3.2 Basic principle**

The VFD is used to control asynchronous AC induction motors and permanent-magnet synchronous motors. The figure below shows the main circuit diagram of the VFD. The rectifier converts 3PH AC voltage into DC voltage, and the capacitor bank of intermediate circuit stabilizes the DC voltage. The VFD converts DC voltage into the AC voltage used by AC motor. When the circuit voltage exceeds the maximum limit value, external braking resistor will be connected to intermediate DC circuit to consume the feedback energy.

Figure 3.1 Main circuit diagram for 015G/018P and lower models

Figure 3.2 Main circuit diagram for 018G/022P-037G/045P

Figure 3.3 Main circuit diagram for 045G/055P-110G/132P

Figure 3.4 Main circuit diagram for 132G/160P and higher models

**Note:**

- 132G/160P and higher models can be connected to external DC reactors. Before connection, take off the copper bar between P1 and (+). 075G/090P and higher models can be connected to external braking units. DC reactors and braking units are optional parts.
- 018G/022P–110G/132P models are equipped with built-in DC reactors.
- 037G/045P and lower models carry built-in braking units. Braking units are optional parts for 045G/055P–055G/075P models and they can be built in or externally connected to the models.

**3.3 Product specifications**

| Function description |                       | Specification                                           |
|----------------------|-----------------------|---------------------------------------------------------|
| Power input          | Input voltage (V)     | AC 3PH 380V (-15%)–440V (+10%)                          |
|                      | Input current (A)     | See "Product ratings".                                  |
|                      | Input frequency (Hz)  | 50Hz or 60Hz, allowable range: 47–63Hz                  |
| Power output         | Output voltage (V)    | 0–Input voltage                                         |
|                      | Output current (A)    | See "Product ratings".                                  |
|                      | Output power (kW)     | See "Product ratings".                                  |
|                      | Output frequency (Hz) | 0–400Hz                                                 |
| Technical            | Control mode          | Space voltage vector control, sensorless vector control |

| Function description        |                                   | Specification                                                                                                                                                                                                              |
|-----------------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| control performance         |                                   | (SVC), and vector control with sensor feedback (FVC)                                                                                                                                                                       |

|                      | Cooling method                     | Forced air cooling                                                                                                                                                                                                                                                                                                                               |
|                      | Braking unit                       | The VFD models of 037G/045P and lower contain built-in braking units. The braking units are optional parts for the 045G/055P–055/075P VFD models, and the braking units can be built in or externally connected.                                                                                                                                 |
|                      | EMC filter                         | The transmission of the VFD meets the IEC/EN 61800-3 C3 requirements.<br>When optional filters are connected externally, the transmission of the VFD can meet the IEC/EN 61800-3 C2 requirements.<br><b>Note:</b> Comply with the EMC requirements and the technical requirements for the motors and motor cables in the appendix in the manual. |

3.4 Product nameplate

Figure 3.5 Product nameplate

Note:

- This is a nameplate example of a standard VFD product. The CE/TUV/IP20 marking on the top right will be marked according to actual certification conditions.
- Scan the QR code at the bottom of the right to download mobile APP and operation manual.

3.5 Model designation code

A model designation code contains product information. You can find the model designation code on the VFD nameplate and simplified nameplate.

| GD350A-500G-4      | 500               | 890               | 860                |                   |                   |                    |

**Note:**

- The VFD input current is measured in cases where the input voltage is 380V without an additional reactor.

- The rated output current is the output current corresponding to 380V output voltage.
- Within the allowable input voltage range, the output current and power cannot exceed the rated output current and power.

### 3.7 Structure diagram

The VFD structure is shown in the following figure (using the 030G/037P VFD model as an example):

Figure 3.7 Structure diagram

| No. | Item                        | Description                                                                                                                                       |
|-----|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Upper cover                 | Used to protect internal components.                                                                                                              |
| 2   | Keypad                      | For details, see "Operating the VFD by keypad".                                                                                                   |
| 3   | Lower cover                 | Used to protect internal components.                                                                                                              |
| 4   | Expansion card              | Optional. For details, see "Expansion cards".                                                                                                     |
| 5   | Control board baffle        | Used to protect the control board and install expansion cards.                                                                                    |
| 6   | Cooling fan                 | For details, see "Maintenance".                                                                                                                   |
| 7   | Keypad interface            | Used to connect the keypad.                                                                                                                       |
| 8   | Nameplate                   | See "Product nameplate".                                                                                                                          |
| 9   | Control terminals           | See "Installation guidelines".                                                                                                                    |
| 10  | Ventilation hole cover      | Optional. Using the ventilation hole cover can enhance the protection rating but also increase the internal temperature, which requires derating. |
| 11  | Main circuit terminals      | For details, see "Installation guidelines".                                                                                                       |
| 12  | POWER indicator             | Indicator of the power supply.                                                                                                                    |
| 13  | GD350A product series label | See "Model designation code".                                                                                                                     |

## 4 Installation guidelines

### 4.1 What this chapter contains

This chapter introduces the mechanical and electrical installations of the VFD.

|                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>✧ Only trained and qualified professionals are allowed to carry out the operations mentioned in this chapter. Please carry out operations according to instructions presented in Safety precautions. Ignoring these safety precautions may lead to physical injury or death, or equipment damage.</li> <li>✧ Ensure the VFD power is disconnected before installation. If the VFD has been powered on, disconnect the VFD and wait for at least the time designated on the VFD, and ensure the POWER indicator is off. Users are recommended to use a multimeter to check and ensure the VFD DC bus voltage is below 36V.</li> <li>✧ Installation must be designed and done according to applicable local laws and regulations. INVT does not assume any liability whatsoever for any installation which breaches local laws and regulations. If recommendations given by INVT are not followed, the VFD may experience problems that the warranty does not cover.</li> </ul> |

### 4.2 Mechanical installation

#### 4.2.1 Installation environment

Installation environment is essential for the VFD to operate at its best in the long run. The installation environment of the VFD should meet the following requirements.

| Environment         | Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Installation site   | Indoors                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Ambient temperature | <ul style="list-style-type: none"> <li>✧ -10—+50°C;</li> <li>✧ When the ambient temperature exceeds 40°C, derate 1% for every additional 1°C;</li> <li>✧ It is not recommended to use the VFD when the ambient temperature is above 50°C;</li> <li>✧ In order to improve reliability, do not use the VFD in cases where the temperature changes rapidly;</li> <li>✧ When the VFD is used in a closed space e.g. control cabinet, use cooling fan or air conditioner to prevent internal temperature from exceeding the temperature required;</li> <li>✧ When the temperature is too low, if restart an VFD which has been idled for a long time, it is required to install external heating device before use to eliminate the freeze inside the VFD, failing to do so may cause damage to the VFD.</li> </ul> |

| Environment            | Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Humidity               | <ul style="list-style-type: none"> <li>✧ The relative humidity (RH) of the air is less than 90%;</li> <li>✧ Condensation is not allowed;</li> <li>✧ The max RH cannot exceed 60% in the environment where there are corrosive gases.</li> </ul>                                                                                                                                                                                                                                                                                                                                           |
| Storage temperature    | -30—+60°C                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Running environment    | <p>The installation site should meet the following requirements.</p> <ul style="list-style-type: none"> <li>✧ Away from electromagnetic radiation sources;</li> <li>✧ Away from oil mist, corrosive gases and combustible gases;</li> <li>✧ Ensure foreign object like metal powder, dust, oil and water will not fall into the VFD (do not install the VFD onto combustible object like wood);</li> <li>✧ Away from radioactive substance and combustible objects;</li> <li>✧ Away from harmful gases and liquids;</li> <li>✧ Low salt content;</li> <li>✧ No direct sunlight</li> </ul> |
| Altitude               | <ul style="list-style-type: none"> <li>✧ Below 1000m;</li> <li>✧ When the altitude exceeds 1000m, derate 1% for every additional 100m;</li> <li>✧ When the altitude exceeds 2000m, configure isolation transformer on the input end of the VFD. It is recommended to keep the altitude below 5000m.</li> </ul>                                                                                                                                                                                                                                                                            |
| Vibration              | The max. amplitude of vibration should not exceed $5.8\text{m/s}^2$ (0.6g)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Installation direction | Install the VFD vertically to ensure good heat dissipation effect                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Note:**

- The VFD must be installed in a clean and well-ventilated environment based on the IP level.
- The cooling air must be clean enough and free from corrosive gases and conductive dust.

**4.2.2 Installation direction**

The VFD can be installed on the wall or in a cabinet.

The VFD must be installed vertically. Check the installation position according to following requirements. See Appendix C Dimension drawings.

Figure 4.1 Installation direction of the VFD

#### 4.2.3 Installation mode

There are three kinds of installation modes based on different VFD dimensions.

- Wall-mounting: suitable for 315G/355P and lower models
- Flange-mounting: suitable for 200G/220P and lower models
- Floor-mounting: suitable for 220G/250P–500G models

Figure 4.2 Installation mode

- (1) Mark the position of the installation hole. See appendix for the position of installation hole;
- (2) Mount the screws or bolts onto the designated position;
- (3) Put the VFD on the wall;
- (4) Tighten the fixing screws on the wall.

#### Note:

- The flange-mounting plate is a must for 1R5G/2R2P–075G/090P models that adopt flange-mounting mode; while 090G/110P–200G/220P models need no flange-mounting plate.
- The installation base is optional for 220G/250P–315G/355P models. The base can hold an input AC reactor (or DC reactor) and an output AC reactor.

#### 4.2.4 Single-unit installation

Figure 4.3 Single-unit installation

**Note:** The min. dimension of B and C is 100mm.

#### 4.2.5 Multiple-unit installation

Figure 4.4 Parallel installation

**Note:**

- When you install VFDs in different sizes, align the top of each VFD before installation for the convenience of future maintenance.
- The min. dimension of B, D and C is 100mm.

### 4.2.6 Vertical installation

Figure 4.5 Vertical installation

**Note:** During vertical installation, you must install windshield, otherwise, the VFD will experience

mutual interference, and the heat dissipation effect will be degraded.

#### 4.2.7 Tilted installation

Figure 4.6 Tilted installation

**Note:** During tilted installation, it is a must to ensure the air inlet duct and air outlet duct are separated from each other to avoid mutual interference.

## 4.3 Main circuit standard wiring

### 4.3.1 Main circuit wiring diagram

Figure 4.7 Main circuit wiring diagram

#### Note:

- The fuse, DC reactor, braking unit, braking resistor, input reactor, input filter, output reactor and output filter are optional parts. See Appendix D Optional peripheral accessories.
- P1 and (+) have been short connected by default for 132G/160P and higher models. If you need to connect to external DC reactor, take off the short-contact tag of P1 and (+).
- When connecting the braking resistor, take off the yellow warning sign marked with PB, (+) and (-) on the terminal block before connecting the braking resistor wire, otherwise, poor contact may occur.
- Braking units are optional parts for 045G/055P–055G/075P models, and they can be built in or externally connected to the models.

4.3.2 Main circuit terminal diagram

Figure 4.8 Main circuit terminal diagram for 022G/030P and lower models

Figure 4.9 Main circuit terminal diagram for 030G/037P–037G/045P models

Figure 4.10 Main circuit terminal diagram for 045G/055P–110G/0132P (optional built-in braking unit means starting PB)

Figure 4.11 Main circuit terminal diagram for 132G/160P–200G/220P models

Figure 4.12 Main circuit terminal diagram for 220G/250P–315G/355P models

Figure 4.13 Main circuit terminal diagram for 355G/400P–500G models

| PB      | Braking resistor terminal 2      | Braking resistor terminal 2                            | Not available                                    |                                                                                                                                                                               |
| PE      | Grounding resistor less than 10Ω |                                                        |                                                  | Grounding terminal for safe protection; each machine must carry two PE terminals and proper grounding is required.                                                            |

**Note:**

- Do not use asymmetrical motor cables. If there is a symmetrical grounding conductor in the motor cable besides the conductive shielded layer, ground the grounding conductor on the VFD end and motor end.
- Braking resistor, braking unit and DC reactor are optional parts.
- Route the motor cables, input power cables and control cables separately.
- "Not available" means this terminal is not for external connection.
- The PB is available for the 045G/055P–110G/132P models only when built-in braking units have been selected for the 045G/055P–055G/75P models.

**4.3.3 Wiring procedure of the main circuit terminals**

1. Connect the ground wire of the input power cable to the PE terminal of the VFD, connect the 3PH input cable to the R, S and T terminals, and tighten up.
2. Connect the ground wire of the motor cable to the PE terminal of the VFD, connect the motor 3PH cable to the U, V and W terminals, and tighten up.
3. Connect optional parts such as the braking resistor that carries cables to designated positions.
4. Fasten all the cables outside the VFD mechanically if allowed.

#### 4.4.2 Input/output signal connection diagram

You can select the NPN/PNP mode and internal/external power through the U-type short connector. NPN internal mode is adopted by default.

Figure 4.16 Position of U-type short connector

**Note:** The USB port can be used to upgrade the software, and the keypad port can be used to connect an external keypad. The external keypad cannot be used when the keypad of the VFD is used.

If input signal comes from NPN transistors, set the U-type short connector between +24V and PW based on the power used according to the following figure.

Figure 4.17 NPN mode

If input signal comes from PNP transistor, set the U-type short connector based on the power used according to the following figure.

Figure 4.18 PNP mode

## 4.5 Wiring protection

### 4.5.1 Protecting the VFD and input power cable in short circuit

The VFD and input power cable can be protected during short-circuit to avoid thermal overload.

Carry out protective measures according to the following requirements.

Figure 4.19 Fuse configuration

**Note:** Select the fuse according to operation manual. During short-circuit, the fuse will protect input power cables to avoid damage to the VFD; when internal short-circuit occurred to the VFD, it can protect neighboring equipment from being damaged.

#### 4.5.2 Protecting the motor and motor cable in short circuit

If the motor cable is selected according to the VFD rated current, the VFD can perform short-circuit protection for the motor and motor cable, without the use of other protective devices.

◇ If the VFD is connected to multiple motors, an additional thermal overload switch or breaker must be used to protect the motor and motor cable. Such a device may use the fuse to cut off the short-circuit current.

#### 4.5.3 Protecting the motor from thermal overload

According to the requirements, the motor must be protected to prevent thermal overload. Once overload is detected, you must cut off the current. The VFD is equipped with motor thermal overload protection function, which will block output and cut off the current (if necessary) to protect the motor.

#### 4.5.4 Bypass connection

In critical occasions, power-variable frequency conversion circuit is necessary to ensure proper operation of the system when VFD fault occurs. In some special cases, for example, only soft startup is needed, it will convert to power-frequency operation directly after soft startup, corresponding bypass link is also needed.

◇ Do not connect the power supply to the VFD output terminals U, V and W. The voltage applied to the motor cable may cause permanent damage to the VFD.

If frequent switchover is needed, you can use the switch/contactors which carries mechanical interlock to ensure motor terminals are not connected to input power cables and VFD output ends simultaneously.

## 5 Basic operation guidelines

### 5.1 What this chapter contains

This chapter describes how to operate the VFD by using the keypad.

### 5.2 Keypad introduction

The VFD has been equipped with the LCD keypad as a standard configuration part. You can use the keypad to control the start and stop, read status data, and set parameters of the VFD.

Figure 5.1 Keypad diagram

**Note:**

- The LCD keypad is equipped with a real-time clock, which can run properly after being installed with batteries even if the power line is disconnected. The clock battery (type: CR2032) is user purchased.
- The LCD keypad has the parameter copying function.
- If you need install the keypad on another position rather than on the VFD, use M3 screws or a keypad installation bracket for fixing, and use a keypad extension cable with a standard RJ45 crystal head.

|----------|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Footer F | Corresponding menus of function keys 4, 5 and 6 | Corresponding menus of function keys 4, 5 and 6. The corresponding menus of function keys 4, 5 and 6 vary with interfaces, and the contents displayed in this area are also different. |

5.3 Keypad display

The VFD keypad can display the stopped-state parameters, running-state parameters, function parameter editing status, and fault alarm status.

5.3.1 Displaying stopped-state parameters

When the VFD is in stopped state, the keypad displays stopped state parameters, and this interface is the main interface during power-on by default. In stopped state, parameters in various states can be displayed. Press  or  to shift the displayed parameters upward or downward.

Figure 5.3 Stopped state parameters

Press  or  to switch between different display styles, including list display style and progress bar display style.

Figure 5.4 Displaying a stopped state parameter

The stopped display parameter list is user defined, and each state variable function code can be added to the stop display parameter list as needed. The state variable which has been added to the stop display parameter list can also be deleted or shifted.

5.3.2 Displaying running-state parameters

After receiving valid running command, the VFD will enter running state, and the keypad displays

running state parameter with **RUN** indicator on the keypad turning on. Under running state, multiple kinds of state parameters can be displayed. Press  or  to shift up or down.

The diagram illustrates the interaction between the Forward and Local Run pages for the 01: GD350A unit. The Forward page displays the Set frequency (P17.01 Hz) at 50.00 and the DC bus voltage (P17.11 V) at 540.0. The Local Run page displays the Set frequency (P17.00 Hz) at 50.00 and the Output voltage (P17.03 V) at 378. Arrows indicate data flow between the two pages.

| 16:02:35         | Forward | Local | Run   | 01: GD350A                                                                                                                                                          |

Figure 5.5 Running state parameters

Press  or  to switch between different display styles, including list display style and progress bar display style.

The diagram illustrates the data flow between two screens. The left screen (Monitoring) displays the DC bus voltage as 540.00 V, the digital input terminal state as 0x0000, and the digital output terminal state as 0x0000. The right screen (Control) displays the DC bus voltage as 540.00 V with a bar graph showing the voltage level relative to a 2000.0 scale. Arrows indicate the flow of data between the two screens.

Figure 5.6 Displaying a running state parameter

Under running state, multiple kinds of state parameters can be displayed. The running display parameter list is defined by the user, and each state variable function code can be added to the running display parameter list as needed. The state variable which has been added to the running display parameter list can also be deleted or shifted.

### 5.3.3 Displaying fault information

The VFD enters fault alarm display state once fault signal is detected, and the keypad displays fault code and fault information with **TRIP** indicator on the keypad turning on. Fault reset operation can be carried out via **STOP/RST** key, control terminal or communication command.

The fault code will be kept displaying until fault is removed.

5.4 Operating the VFD by keypad

You can perform various operations on the VFD by using the keypad, including entering/exiting menus, parameter selection, list modification and parameter addition.

5.4.1 Enter/exit menu

Regarding the monitoring menu, the operation relation between enter and exit is shown below.

Figure 5.8 Enter/exit menu diagram 1

Regarding the system menu, the operation relation between enter and exit is shown below.

Figure 5.9 Enter/exit menu diagram 2

The keypad menu setup is shown in the following.

| Level 1                | Level 2                       | Level 3                                            | Level 4                            |

5.4.2 List edit

The monitoring items displayed in the parameter list of stop state can be added by users as needed (through the menu of the function code in state check group), and the list can also be edited by users e.g. "shift up", "shift down" and "delete from the list". The edit function is shown in the interface below.

Figure 5.10 List edit diagram 1

Press key to enter edit interface, select the operation needed, and press key, key or key to confirm the edit operation and return to the previous menu (parameter list), the returned list is the list edited. If key or key is pressed in edit interface without selecting edit operation, it will return to the previous menu (parameter list remain unchanged).

**Note:** For the parameter objects in the list header, shift-up operation will be invalid, and the same principle can be applied to the parameter objects in the list footer; after deleting a certain parameter, the parameter objects under it will be shifted up automatically.

The monitoring items displayed in the parameter list of running state can be added by users as needed (through the menu of the function code in state check group), and the list can also be edited by users e.g. "shift up", "shift down" and "delete from the list". The edit function is shown in the interface below.

Figure 5.11 List edit diagram 2

The parameter list of common parameter setup can be added, deleted or adjusted by users as needed, including delete, shift-up and shift-down; the addition function can be set in a certain function code of a function group. The edit function is shown in the figure below.

Figure 5.12 List edit diagram 3

#### 5.4.3 Add parameters to the parameter list displayed in stop/running state

In the fourth-level menu of "State monitoring", the parameters in the list can be added to the "parameter displayed in stop state" list or "parameter displayed in running state" list as shown below.

Figure 5.13 Add parameter diagram 1

Press key to enter parameter addition interface, select the operation needed, and press key, key or key to confirm the addition operation. If this parameter is not included in the "parameter displayed in stop state" list or "parameter displayed in running state" list, the parameter added will be at the end of the list; if the parameter is already in the "parameter displayed in stop state" list or "parameter displayed in running state" list, the addition operation will be invalid. If key or key is pressed without selecting addition operation in "Addition" interface, it will return to monitoring parameter list menu.

Part of the monitoring parameters in P07 HMI group can be added to the "parameter displayed in stop

state" list or "parameter displayed in running state" list; All the parameters in P17, P18 and P19 group can be added to the "parameter displayed in stop state" list or "parameter displayed in running state" list.

Up to 16 monitoring parameters can be added to the "parameter displayed in stop state" list; and up to 32 monitoring parameters can be added to the "parameter displayed in running state" list.

5.4.4 Add parameter to common parameter setup list

In fourth-level menu of "parameter setup" menu, the parameter in the list can be added to the "common parameter setup" list as shown below.

Figure 5.14 Add parameter diagram 2

Add key to enter addition interface, and press key, key or key to confirm the addition operation. If this parameter is not included in the original "common parameter setup" list, the newly-added parameter will be at the end of the list; if this parameter is already in the "common parameter setup" list, the addition operation will be invalid. If key or key is pressed without selecting addition operation, it will return to parameter setup list menu.

All the function code groups under parameter setup sub-menu can be added to "common parameter setup" list. Up to 64 function codes can be added to the "common parameter setup" list.

5.4.5 Parameter selection edit interface

In the fourth-level menu of "parameter setup" menu, press key, key or key to enter parameter selection edit interface. After entering edit interface, current value will be highlighted. Press key and key to edit current parameter value, and the corresponding parameter item of current value will be highlighted automatically. After parameter selection is done, press key or key to save the selected parameter and return to the previous menu. In parameter selection edit interface, press key to maintain the parameter value and return to the previous menu.

Figure 5.15 Parameter selection edit interface

In parameter selection edit interface, the "authority" on the top right indicates whether this parameter is editable or not.

" ✓ " indicates the set value of this parameter can be modified under current state.

" x " indicates the set value of this parameter cannot be modified under current state.

"Current value" indicates the value of current option.

"Default value" indicates the default value of this parameter.

**5.4.6 Parameter setup edit interface**

In the fourth-level menu in "parameter setup" menu, press key, key or key to enter parameter setup edit interface. After entering edit interface, set the parameter from low bit to high bit, and the bit under setting will be highlighted. Press key or key to increase or decrease the parameter value (this operation is valid until the parameter value exceeds the max. value or min. value); press or to shift the edit bit. After parameters are set, press key or key to save the set parameters and return to the previous parameter. In parameter setup edit interface, press to maintain the original parameter value and return to the previous menu.

Figure 5.16 Parameter setup edit interface

In parameter selection edit interface, the "authority" on the top right indicates whether this parameter can be modified or not.

" ✓ " indicates the set value of this parameter can be modified under current state.

" x " indicates the set value of this parameter cannot be modified under current state.

"Current value" indicates the value saved last time.

"Default value" indicates the default value of this parameter.

**5.4.7 State monitoring interface**

In the fourth-level menu of "state monitoring/fault record" menu, press key, key or key

key to enter state monitoring interface. After entering state monitoring interface, the current parameter value will be displayed in real time, this value is the actually detected value which cannot be modified.

In state monitoring interface, press  key or  key to return to the previous menu.

Figure 5.17 State monitoring interface

#### 5.4.8 Motor parameter autotuning

In "Motor parameter autotuning" menu, press  key,  key or  key to enter motor parameter autotuning selection interface, however, before entering motor parameter autotuning interface, users must set the motor nameplate parameters correctly. After entering the interface, select motor autotuning type to carry out motor parameter autotuning. In motor parameter autotuning interface, press  key or  key to return to the previous menu.

Figure 5.18 Parameter autotuning operation diagram

After selecting motor autotuning type, enter motor parameter autotuning interface, and press **RUN** key to start motor parameter autotuning. After autotuning is done, a prompt will pop out indicating autotuning is succeeded, and then it will return to the main interface of stop. During autotuning, users can press **STOP/RST** key to terminate autotuning; if any fault occur during autotuning, the keypad will pop out a fault interface.

Figure 5.19 Parameter autotuning finished

#### 5.4.9 Parameter backup

In "parameter backup" menu, press  key,  key or  key to enter function parameter backup setting interface and function parameter restoration setup interface to upload/download VFD parameters, or restore VFD parameters to default value. The keypad has three different storage

areas for parameter backup, and each storage area can save the parameters of one VFD, namely it can save parameters of three VFD in total.

Figure 5.20 Parameter backup operation diagram

5.4.10 System setup

In "System setup" menu, press key, key or key to enter system setup interface to set keypad language, time/date, backlight brightness, backlight time and restore parameters.

Note: Clock battery is not included, and the keypad time/date needs to be reset after power off. If time-keeping after power off is needed, users should purchase the clock batteries separately.

Figure 5.21 System setup diagram

5.4.11 Power-on guiding settings

The keyboard supports the power-on guiding function, mainly for the first power-on situation, guiding the user to enter the setting menu, and gradually implementing basic functions such as basic parameter setting, direction judgment, mode setting and autotuning. The power-on guiding enable menu guides the user to enable power-on to boot each time. Power-on guiding setup menu guides the user to set step by step according to the functions.

The power-on guide is shown as below.

| Level 1  |                       | Level 2                 |                       | Level 3                                         |           | Level 4                                       |     |

## 5.5 Basic operations

### 5.5.1 What this section contains

This section introduces the function modules inside the VFD.

- ✧ Ensure all the terminals are fixed and tightened firmly.
- ✧ Ensure the motor matches with the VFD power.

### 5.5.2 Common commissioning procedure

The common operation procedure is shown in the following (taking motor 1 as an example).

**Note: If fault occurred, rule out the fault cause according to "fault tracking".**

The running command channel can be set by terminal commands besides P00.01 and P00.02.

| Current running command channel<br>P00.01 | Multi-function terminal function (36)<br>Command switches to keypad | Multi-function terminal function (37)<br>Command switches to terminal | Multi-function terminal function (38)<br>Command switches to communication |

### 5.5.3 Vector control

AMs feature high order, nonlinearity, strong coupling and multi-variables, which increase difficulty to control AMs during actual application. The vector control technology solves this situation as follows: measures and controls the stator current vector of the AM, and then decomposes the stator current vector into exciting current (current component that generates internal magnet field) and torque current (current component that generates torque) based on field orientation principle, and therefore controls the amplitude values and phase positions of the two components (namely, controls the stator current vector of the AM) to realize decoupled control on exciting current and torque current, thus achieving high-performance speed regulation of the AM.

The VFD uses the sensor-less vector control algorithm, which can be used to drive AMs and permanent-magnet SMs simultaneously. As the core algorithm of vector control is based on accurate motor parameter models, the accuracy of motor parameters affects vector control performance. It is recommended to enter accurate motor parameters and autotune motor parameters before executing vector control.

As the vector control algorithm is complicated, exercise caution before modifying vector control

function parameters.

#### 5.5.4 Space voltage vector control mode

The VFD also provides the space voltage control function. The space voltage control mode can be used in cases where mediocre control precision is enough and in cases where the VFD needs to drive multiple motors.

The VFD provides multiple V/F curve modes to meet different requirements. You can select V/F curves or set V/F curves as required.

#### Suggestions:

- For the load featuring constant moment, such as conveyor belt which runs in straight line, as the whole running process requires constant moment, it is recommended to adopt the straight line V/F curve.
- For the load featuring decreasing moment, such as fan and water pumps, as there is a power (square or cube) relation between its actual torque and speed, it is recommended to adopt the V/F curve corresponding to the power of 1.3, 1.7 or 2.0.

The VFD also provides multi-point V/F curves. You can change the V/F curves output by the VFD by setting the voltage and frequency of the three points in the middle. A whole curve consists of five points starting from (0Hz, 0V) and ending at (motor fundamental frequency, motor rated voltage). During setting, follow the rule:  $0 \leq f_1 \leq f_2 \leq f_3 \leq \text{Motor fundamental frequency}$ , and,  $0 \leq V_1 \leq V_2 \leq V_3 \leq \text{Motor rated voltage}$

The VFD provides dedicated function codes for the space voltage control mode. You can improve the space voltage control performance by means of setting.

The VFD provides dedicated function codes for the space voltage control mode. You can improve the space voltage control performance by means of setting.

**(1) Torque boost**

The torque boost function can effectively compensate for the low-speed torque performance in space voltage control. Automatic torque boost has been set by default, which enables the VFD to adjust the torque boost value based on actual load conditions.

**Note:**

- Torque boost takes effect only at the torque boost cut-off frequency.
- If torque boost is too large, the motor may encounter low-frequency vibration or overcurrent. If such a situation occurs, reduce the torque boost value.

## (2) Energy-saving run

During actual running, the VFD can search for the max. efficiency point to keep running in the most efficient state to save energy.

### Note:

- This function is generally used in light load or no-load cases.
- This function is not applicable to the cases where sudden load changes often occur.

## (3) V/F slip compensation gain

Space voltage vector control belongs to an open-loop mode. Sudden motor load changes cause motor speed fluctuation. In cases where strict speed requirements must be met, you can set the slip compensation gain to compensate for the speed change caused by load fluctuation through VFD internal output adjustment.

The setting range of slip compensation gain is 0–200%, in which 100% corresponds to the rated slip frequency.

**Note:** Rated slip frequency = (Rated synchronous rotation speed of motor – Rated rotation speed of motor) × (Number of motor pole pairs)/60

## (4) Oscillation control

Motor oscillation often occurs in space voltage vector control in large-power driving applications. To solve this problem, the VFD provides two oscillation factor function codes. You can set the function codes based on the oscillation occurrence frequency.

**Note:** A greater value indicates better control effect. However, if the value is too large, the VFD output current may be too large.

**(5) AM IF control**

Generally, the IF control mode is valid for AMs. It can be used for SMs only when the frequency is extremely low. Therefore, the IF control mode described in this manual is only involved with AMs. IF control is implemented by performing closed-loop control on the total output current of the VFD. The output voltage adapts to the current reference, and open-loop control is separately performed over the frequency of the voltage and current.

Customized V/F curve (V/F separation) function:

When selecting the customized V/F curve function, you can specify the setting channels and acceleration/deceleration time of voltage and frequency respectively, which form a real-time V/F curve

in combination manner.

**Note:** This type of V/F curve separation can be applied in various variable-frequency power sources. However, exercise caution when setting parameters as improper settings may cause equipment damage.

### 5.5.5 Torque control

The VFD supports torque control and speed control. Speed control aims to stabilize the speed to keep the set speed consistent with the actual running speed, meanwhile, the max. load-carrying capacity is restricted by the torque limit. Torque control aims to stabilize the torque to keep the set torque consistent with the actual output torque, meanwhile, the output frequency is restricted by the upper and lower limits.

#### 5.5.6 Motor parameters

|                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>✧ Check the safety conditions surrounding the motor and load machineries before autotuning as physical injury may occur due to sudden start of motor during autotuning.</li> <li>✧ Although the motor does not run during static autotuning, the motor is still supplied with power. Do not touch the motor during autotuning; otherwise, electric shock may occur. Do not touch the motor before autotuning is completed.</li> </ul> |
|  | <ul style="list-style-type: none"> <li>✧ If the motor has been connected to a load, do not carry out rotary autotuning. Otherwise, the VFD may malfunction or may be damaged. If rotary autotuning is carried out on a motor which has been connected to a load, incorrect motor parameter settings and motor action exceptions may occur. Disconnect from the load to carry out autotuning if necessary.</li> </ul>                                                         |

The VFD can drive both asynchronous motors and synchronous motors, and it supports two sets of motor parameters, which can be switched over by multifunction digital input terminals or communication modes.

The control performance of the VFD is based on accurate motor models. Therefore, you need to carry out motor parameter autotuning before running a motor for the first time (taking motor 1 as an example).

**Note:**

- Motor parameters must be set correctly according to the motor nameplate.
- If rotary autotuning is selected during motor autotuning, disconnect the motor from the load to put

the motor in static and no-load state. Otherwise, the motor parameter autotuning results may be incorrect. In addition, autotune **P02.06–P02.10** for AMs and autotune **P02.20–P02.23** for SMs.

- If static autotuning is selected for motor autotuning, there is no need to disconnect the motor from the load, but the control performance may be impacted as only a part of the motor parameters have been autotuned. In addition, autotune **P02.06–P02.10** for AMs and autotune **P02.20–P02.22** for SMs. **P02.23** can be obtained through calculation.
- Motor autotuning can be carried out on the present motor only. If you need to perform autotuning on the other motor, switch the motor through selecting the switchover channel of motor 1 and motor 2 by setting the ones place of **P08.31**.

### 5.5.7 Start/stop control

The start/stop control of the VFD involves three states: start after a running command is given at power-on; start after power-off restart is effective; start after automatic fault reset. The three start/stop control states are described in the following.

There are three start modes for the VFD, which are start at starting frequency, start after DC braking, and start after speed tracking. You can select the proper start mode based on actual conditions.

For large-inertia load, especially in cases where reversal may occur, you can choose to start after DC braking or start after speed tracking.

**Note: It is recommended to drive SMs in direct start mode.**

### 5.5.8 Frequency setting

The VFD supports multiple frequency setting methods, which can be divided into two types: main reference channel and auxiliary reference channel.

There are two main reference channels, namely frequency reference channel A and frequency reference channel B. These two channels support simple arithmetical operation between each other, and they can be switched dynamically by setting multi-function terminals.

There is one input mode for auxiliary reference channel, namely terminal **UP/DOWN** switch input. By setting function codes, you can enable the corresponding reference mode and the impact made on the VFD frequency reference by this reference mode.

The actual reference of VFD is comprised of the main reference channel and auxiliary reference channel.

The VFD supports switchover between different reference channels, and the rules for channel switchover are shown in the following.

| Present reference channel<br><u>P00.09</u> | Multifunction terminal function 13<br>Channel A switched to channel B | Multifunction terminal function 14<br>Combination setting switched to channel A | Multifunction terminal function 15<br>Combination setting switched to channel B |
|--------------------------------------------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| A                                          | B                                                                     | /                                                                               | /                                                                               |
| B                                          | A                                                                     | /                                                                               | /                                                                               |
| A+B                                        | /                                                                     | A                                                                               | B                                                                               |
| A-B                                        | /                                                                     | A                                                                               | B                                                                               |
| Max(A,B)                                   | /                                                                     | A                                                                               | B                                                                               |
| Min(A,B)                                   | /                                                                     | A                                                                               | B                                                                               |

**Note:** "/" indicates this multifunction terminal is invalid under present reference channel.

When setting the auxiliary frequency inside the VFD via multi-function terminal UP (10) and DOWN (11), you can increase/decrease the frequency quickly by setting P08.45 (UP terminal frequency incremental change rate) and P08.46 (DOWN terminal frequency decrement change rate).

### 5.5.9 Analog input

The VFD provides two analog input terminals, which are AI1 supporting 0–10V/0–20mA, (whether the input is voltage or current can be set by P05.50), and AI2 supporting -10–10V, and two high-speed pulse input terminals. Each input can be filtered separately, and the corresponding reference curve can be set by adjusting the reference corresponds to the max. value and min. value.

### 5.5.10 Analog output

The VFD provides one analog output terminal (supporting 0–10V/0–20mA) and one high-speed pulse output terminal. Analog output signals can be filtered separately, and the proportional relation can be adjusted by setting the max. value, min. value, and the percentage of their corresponding output. Analog output signals can output the motor speed, output frequency, output current, motor torque and motor power at a certain proportion.

Terminal output is described as follows:

| Setting | Function                           | Description                                                                     |
|---------|------------------------------------|---------------------------------------------------------------------------------|
| 0       | Running frequency                  | 0–Max. output frequency                                                         |
| 1       | Set frequency                      | 0–Max. output frequency                                                         |
| 2       | Ramp reference frequency           | 0–Max. output frequency                                                         |
| 3       | Running speed                      | 0–Synchronous speed corresponding to max. output frequency                      |
| 4       | Output current (relative to VFD)   | 0–Twice the VFD rated current                                                   |
| 5       | Output current (relative to motor) | 0–Twice the motor rated current                                                 |
| 6       | Output voltage                     | 0–1.5 times the VFD rated voltage                                               |
| 7       | Output power                       | 0–Twice the rated power                                                         |
| 8       | Set torque value (bipolar)         | 0–Twice the VFD rated current. A negative value corresponds to 0.0% by default. |
| 9       | Output torque (absolute value)     | 0 – +/- (Twice the motor rated torque)                                          |
| 10      | AI1 input                          | 0–10V/0–20mA                                                                    |
| 11      | AI2 input                          | 0V–10V. A negative value corresponds to                                         |

| Setting | Function                                                        | Description                                                                                                  |
|---------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
|         |                                                                 | 0.0% by default.                                                                                             |
| 12      | AI3 input                                                       | 0–10V/0–20mA                                                                                                 |
| 13      | High-speed pulse HDIA input                                     | 0.00–50.00kHz                                                                                                |
| 14      | Value 1 set through Modbus/Modbus TCP communication             | 0–1000                                                                                                       |
| 15      | Value 2 set through Modbus/Modbus TCP communication             | 0–1000                                                                                                       |
| 16      | Value 1 set through PROFIBUS/CANopen/DeviceNet communication    | 0–1000                                                                                                       |
| 17      | Value 2 set through PROFIBUS/CANopen/DeviceNet communication    | 0–1000                                                                                                       |
| 18      | Value 1 set through Ethernet communication                      | 0–1000                                                                                                       |
| 19      | Value 2 set through Ethernet communication                      | 0–1000                                                                                                       |
| 20      | High-speed pulse HDIA input                                     | 0.00–50.00kHz                                                                                                |
| 21      | Value 1 set through EtherCAT/Profinet/EtherNet/IP communication | 0–1000. A negative value corresponds to 0.0% by default.                                                     |
| 22      | Torque current (bipolar)                                        | 0–Three times the motor rated current. A negative value corresponds to 0.0% by default.                      |
| 23      | Exciting current                                                | 0–Three times the motor rated current. A negative value corresponds to 0.0% by default.                      |
| 24      | Set frequency (bipolar)                                         | 0–Max. output frequency. A negative value corresponds to 0.0% by default.                                    |
| 25      | Ramp reference frequency (bipolar)                              | 0–Max. output frequency. A negative value corresponds to 0.0% by default.                                    |
| 26      | Rotational speed (bipolar)                                      | 0–Synchronous speed corresponding to max. output frequency. A negative value corresponds to 0.0% by default. |
| 27      | Value 2 set through EtherCat/Profinet/EtherNet/IP communication | 0–1000                                                                                                       |
| 28      | C_AO1 from PLC                                                  | 0–1000                                                                                                       |

| Setting | Function                | Description                                                                  |

5.5.11 Digital input

The VFD provides four programmable digital input terminals and two HDI input terminals. All the digital input terminal functions can be programmed by function codes. HDI input terminal can be set to act as high-speed pulse input terminal or common digital input terminal; if it is set to act as high-speed pulse input terminal, you can also set HDIA or HDIB high-speed pulse input to serve as the frequency reference and encoder signal input.

**Note:** Two different multifunction input terminals cannot be set as the same function.

| Setting | Function    | Description                                             |
|---------|-------------|---------------------------------------------------------|
| 0       | No function | The VFD does not act even if there is signal input. Set |

| Setting | Function                                      | Description                                                                                                                                                                                                                                              |

|         |                                               | unused terminals without functions to avoid misaction.                                                                                                                                                                                                   |
| 1       | Run forward (FWD)                             | Control the forward/reverse running of the VFD by external terminals.                                                                                                                                                                                    |
| 2       | Run reversely (REV)                           |                                                                                                                                                                                                                                                          |
| 3       | Three-wire running control                    | Set the VFD running mode to 3-wire control mode by this terminal. See <a href="#">P05.13</a> for details.                                                                                                                                                |
| 4       | Jog forward                                   | For details about the frequency and ACC/DEC time at jogging, see <a href="#">P08.06</a> , <a href="#">P08.07</a> and <a href="#">P08.08</a> .                                                                                                            |
| 5       | Jog reversely                                 |                                                                                                                                                                                                                                                          |
| 6       | Coast to stop                                 | The VFD blocks output, and the stop process of motor is uncontrolled by the VFD. This mode is applied in cases of large-inertia load and free stop time; its definition is the same as <a href="#">P01.08</a> , and it is mainly used in remote control. |
| 7       | Fault reset                                   | External fault reset function, same as the reset function of the <b>STOP/RST</b> key on the keypad. You can use this function to reset faults remotely.                                                                                                  |
| 8       | Pause running                                 | When the VFD decelerates to stop, however, all the running parameters are in memory state, including PLC parameter, wobbling frequency, and PID parameter. After this signal disappears, the VFD restores to the state before stop.                      |
| 9       | External fault input                          | When an external fault signal is transmitted to the VFD, the VFD releases a fault alarm and stops.                                                                                                                                                       |
| 10      | Increase frequency setting (UP)               | Used to change the frequency increase/decrease command when the frequency is given by external terminals.<br><br>                                                     |
| 12      | Decrease frequency setting (DOWN)             |                                                                                                                                                                                                                                                          |
| 12      | Clear the frequency increase/decrease setting |                                                                                                                                                                                                                                                          |

The terminal used to clear frequency increase/decrease setting can clear the frequency value of auxiliary channel set by **UP/DOWN**, thus restoring the reference frequency to the frequency given by main reference frequency command channel.

| Setting            | Function                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                      |                      |                    |                    |             |             |                |                      |    |     |                |                      |     |    |                |                      |    |    |                |                      |

| Setting | Function                                                  | Description                                                                                                                                                                                                                                                                                   |
|---------|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27      | Reset wobbling frequency (back to the central frequency)  | The set frequency of VFD returns to the center frequency.                                                                                                                                                                                                                                     |
| 28      | Counter reset                                             | The counter is cleared.                                                                                                                                                                                                                                                                       |
| 29      | Switch between speed control and torque control           | The VFD switches from torque control mode to speed control mode, or vice versa.                                                                                                                                                                                                               |
| 30      | Disable ACC/DEC                                           | Used to ensure the VFD is not be impacted by external signals (except for stop command), and the VFD maintains the present output frequency.                                                                                                                                                  |
| 31      | Trigger the counter                                       | Used to enable the counter to count pulses.                                                                                                                                                                                                                                                   |
| 33      | Clear the frequency increase/decrease setting temporarily | When the terminal is closed, the frequency value set by <b>UP/DOWN</b> can be cleared to restore the reference frequency to the frequency given by frequency command channel; when terminal is disconnected, it will revert to the frequency value after frequency increase/decrease setting. |
| 34      | DC braking                                                | The VFD immediately starts DC braking once after the command is valid.                                                                                                                                                                                                                        |
| 35      | Switch between motor 1 and motor 2                        | When the function is valid, the switchover between the two motors can be controlled.                                                                                                                                                                                                          |
| 36      | Switch the running command channel to keypad              | When the function is enabled, the running command channel is switched to keypad. When the function is disabled, the running command channel is restored to the previous setting.                                                                                                              |
| 37      | Switch the running command channel to terminal            | When the function is enabled, the running command channel is switched to terminal. When the function is disabled, the running command channel is restored to the previous setting.                                                                                                            |
| 38      | Switch the running command channel to communication       | When the function is enabled, the running command channel is switched to communication. When the function is disabled, the running command channel is restored to the previous setting.                                                                                                       |
| 39      | Pre-exciting command                                      | When this terminal is valid, motor pre-exciting is started and continues until this terminal becomes invalid.                                                                                                                                                                                 |
| 40      | Clear electricity consumption                             | When this command becomes valid, the electricity consumption quantity of the VFD is cleared.                                                                                                                                                                                                  |
| 41      | Keep electricity consumption                              | When this command is valid, the present running of the VFD has no impact on the electricity consumption quantity.                                                                                                                                                                             |

| Setting | Function                                                          | Description                                                                                                      |
|---------|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 42      | Switch the setting source of braking torque upper limit to keypad | When this command is valid, the upper limit of the torque is set through the keypad.                             |
| 43      | Position reference point input                                    | Valid only for S1, S2, and S3.                                                                                   |
| 44      | Disable spindle orientation                                       | Used to disable spindle orientation.                                                                             |
| 45      | Spindle zeroing / Local positioning zeroing                       | Used to trigger and enable spindle orientation.                                                                  |
| 46      | Spindle zero position selection 1                                 | Spindle zero position selection 1 made through terminals                                                         |
| 47      | Spindle zero position selection 2                                 | Spindle zero position selection 2 made through terminals                                                         |
| 48      | Spindle scale division selection 1                                | Spindle scale division selection 1 made through terminals                                                        |
| 49      | Spindle scale division selection 2                                | Spindle scale division selection 2 made through terminals                                                        |
| 50      | Spindle scale division selection 3                                | Spindle scale division selection 3 made through terminals                                                        |
| 51      | Terminal for switching between position control and speed control | Used to switch between position control and speed control                                                        |
| 52      | Disable pulse input                                               | When this function is valid, pulse input is invalid.                                                             |
| 53      | Clear position deviation                                          | Used to clear the input deviation of the position loop.                                                          |
| 54      | Switch position proportional gains                                | Used to switch position proportional gains.                                                                      |
| 55      | Enable cyclic digital positioning                                 | When the digital positioning mode is valid, the cyclic digital positioning function can be enabled.              |
| 56      | Emergency stop                                                    | When this command is valid, the motor decelerates to emergency stop according to the time set by <u>P01.25</u> . |
| 57      | Motor overtemperature fault input                                 | The motor stops at motor over-temperature fault input.                                                           |
| 59      | Switch from FVC to space voltage vector control                   | When this terminal is valid in stop state, the space voltage vector control mode is used.                        |
| 60      | Switch to FVC control                                             | When this terminal is valid in stop state, the FVC mode is used.                                                 |
| 61      | Switch PID polarities                                             | Used together with <u>P09.03</u> .                                                                               |
| 62      | Reserved                                                          |                                                                                                                  |

| Setting | Function                   | Description                                                                                                                                                                                                   |
|---------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 63      | Enable servo               | When the thousands place of <u>P21.00</u> determines to enable servo, the servo enabling terminal is valid, which controls to VFD to enter zero servo control. At this time, a start command is not required. |
| 64      | Limit on forward running   | Used to specify the limit on forward running.                                                                                                                                                                 |
| 65      | Limit on reverse running   | Used to specify the limit on reverse running.                                                                                                                                                                 |
| 66      | Clear encoder counting     | Used to clear encoder counting.                                                                                                                                                                               |
| 67      | Increase pulses            | When the terminal function is valid, the pulse input is increased according to the <u>P21.27</u> pulse speed.                                                                                                 |
| 68      | Enable pulse superposition | When the pulse superimposition is enabled, pulse increase and pulse decrease are effective.                                                                                                                   |
| 69      | Decrease pulses            | When the terminal function is valid, the pulse input is decreased according to the <u>P21.27</u> pulse speed.                                                                                                 |
| 70      | Electronic gear selection  | When the terminal is valid, the proportional numerator is switched to the <u>P21.30</u> numerator of the 2nd command ratio.                                                                                   |
| 71      | Switch to master           | In stopped state, if the function is valid, the master is used.                                                                                                                                               |
| 72      | Switch to slave            | In stopped state, if the function is valid, the slave is used.                                                                                                                                                |
| 73      | Trigger fire mode control  | If fire mode control is triggered, P28.25 is valid.                                                                                                                                                           |

### 5.5.12 Digital output

The VFD provides two groups of relay output terminals, one open collector Y output terminal and one high-speed pulse output (HDO) terminal. All the digital output terminal functions can be programmed by function codes, of which the high-speed pulse output terminal HDO can also be set to high-speed pulse output or digital output by function code.

The following table lists the function code options. A same output terminal function can be repeatedly selected.

| Setting | Function                       | Description                                                                                                                                   |
|---------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 0       | Invalid                        | Output terminal has no function                                                                                                               |
| 1       | In running                     | Output ON signal when there is frequency output during running                                                                                |
| 2       | In forward running             | Output ON signal when there is frequency output during forward running                                                                        |
| 3       | In reverse running             | Output ON signal when there is frequency output during reverse running                                                                        |
| 4       | In jogging                     | Output ON signal when there is frequency output during jogging                                                                                |
| 5       | VFD fault                      | Output ON signal when VFD fault occurred                                                                                                      |
| 6       | Frequency level detection FDT1 | Refer to <a href="#">P08.32</a> and <a href="#">P08.33</a> .                                                                                  |
| 7       | Frequency level detection FDT2 | Refer to <a href="#">P08.34</a> and <a href="#">P08.35</a> .                                                                                  |
| 8       | Frequency reached              | Refer to <a href="#">P08.36</a> .                                                                                                             |
| 9       | Running in zero speed          | Output ON signal when the VFD output frequency and reference frequency are both zero.                                                         |
| 10      | Reach upper limit frequency    | Output ON signal when the running frequency reaches upper limit frequency                                                                     |
| 11      | Reach lower limit frequency    | Output ON signal when the running frequency reached lower limit frequency                                                                     |
| 12      | Ready to run                   | Main circuit and control circuit powers are established, the protection functions do not act; when the VFD is ready to run, output ON signal. |
| 13      | In pre-exciting                | Output ON signal during pre-exciting of the VFD                                                                                               |
| 14      | Overload pre-alarm             | Output ON signal after the pre-alarm time                                                                                                     |

| Setting | Function                                                               | Description                                                                                                                                                                               |
|---------|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         |                                                                        | elapsed based on the pre-alarm threshold; see <a href="#">P11.08–P11.10</a> for details.                                                                                                  |
| 15      | Underload pre-alarm                                                    | Output ON signal after the pre-alarm time elapsed based on the pre-alarm threshold; see <a href="#">P11.11–P11.12</a> for details.                                                        |
| 16      | Simple PLC state completed                                             | Output signal when current stage of simple PLC is completed                                                                                                                               |
| 17      | Simple PLC cycle completed                                             | Output signal when a single cycle of simple PLC operation is completed                                                                                                                    |
| 23      | Virtual terminal output of Modbus/Modbus TCP communication             | Output corresponding signal based on the set value of Modbus/Modbus TCP; output ON signal when it is set to 1, output OFF signal when it is set to 0                                      |
| 24      | Virtual terminal output of PROFIBUS/CANopen/DeviceNET communication    | Output corresponding signal based on the set value of PROFIBUS\CANopen; output ON signal when it is set to 1, output OFF signal when it is set to 0                                       |
| 25      | Virtual terminal output of Ethernet communication                      | Output corresponding signal based on the set value of Ethernet; output ON signal when it is set to 1, output OFF signal when it is set to 0.                                              |
| 26      | DC bus voltage established                                             | Output is valid when the bus voltage is above the undervoltage threshold of the inverter                                                                                                  |
| 27      | Z pulse output                                                         | Output is valid when the encoder Z pulse is arrived, and is invalid after 10 ms.                                                                                                          |
| 28      | During pulse superposition                                             | Output is valid when the pulse superposition terminal input function is valid                                                                                                             |
| 29      | STO action                                                             | Output when STO fault occurred                                                                                                                                                            |

### 5.5.13 Simple PLC

Simple PLC is a multi-step speed generator, and the VFD can change the running frequency and direction automatically based on the running time to fulfill process requirements. Previously, such function was realized with external PLC, while now, the VFD itself can achieve this function.

The VFD can realize 16-step speeds control, and provide four groups of acceleration/deceleration time for you to choose.

After the set PLC completes one cycle (or one segment), one ON signal can be output by the multifunction relay.

### 5.5.14 Multi-step speed running

The VFD can set 16-step speeds, which are selectable by multi-step speed terminals 1–4, corresponding to multi-step speed 0 to multi-step speed 15.

disappears. Integral regulator can be used to eliminate static difference; however, too large regulation may lead to repetitive overshoot, which will cause system instability and oscillation. The feature of oscillation caused by strong integral effect is that the feedback signal fluctuates up and down based on the reference variable, and fluctuation range increases gradually until oscillation occurred. Integral time parameter is generally regulated gradually from large to small until the stabilized system speed fulfills the requirement.

Derivative time ( $T_d$ ): When the deviation between feedback and reference changes, output the regulating variable which is proportional to the deviation variation rate, and this regulating variable is only related to the direction and magnitude of the deviation variation rather than the direction and magnitude of the deviation itself. Differential control is used to control the feedback signal variation based on the variation trend. Differential regulator should be used with caution as it may easily enlarge the system interferences, especially those with high variation frequency.

When the frequency command selection (P00.06, P00.07) is 7 or the voltage setting channel selection (P04.27) is 6, the VFD is process PID controlled.

#### **5.5.15.1 General procedures for PID parameter settings**

##### **a. Determining proportional gain P**

When determining proportional gain P, first, remove the integral term and derivative term of PID by making  $T_i=0$  and  $T_d=0$  (see PID parameter setup for details), thus turning PID into pure proportional control. Set the input to 60%–70% of the max. allowable value, and increase proportional gain P gradually from 0 until system oscillation occurred, and then in turn, decrease proportional gain P gradually from current value until system oscillation disappears, record the proportional gain P at this point and set the proportional gain P of PID to 60%–70% of current value. This is whole commissioning process of proportional gain P.

##### **b. Determine integral time $T_i$**

After proportional gain P is determined, set the initial value of a larger integral time  $T_i$ , and decrease  $T_i$  gradually until system oscillation occurred, and then in turn, increase  $T_i$  until system oscillation disappears, record the  $T_i$  at this point, and set the integral time constant  $T_i$  of PID to 150%–180% of current value. This is the commissioning process of integral time constant  $T_i$ .

##### **c. Determining derivative time $T_d$**

The derivative time  $T_d$  is generally set to 0.

If you need to set  $T_d$  to another value, set in the same way with P and  $T_i$ , namely set  $T_d$  to 30% of the value when there is no oscillation.

d. Empty system load, perform load-carrying joint debugging, and then fine-tune PID parameter until fulfilling the requirement.

#### **5.5.15.2 PID adjusting methods**

After setting the parameters controlled by PID, you can adjust these parameters by the following means.

**Control overshoot:** When overshoot occurred, shorten the derivative time ( $T_d$ ) and prolong integral time ( $T_i$ ).

**Stabilize the feedback value as fast as possible:** when overshoot occurred, shorten integral time ( $T_i$ ) and prolong derivative time ( $T_d$ ) to stabilize control as fast as possible.

**Control long-term vibration:** If the cycle of periodic vibration is longer than the set value of integral time ( $T_i$ ), it indicates the integral action is too strong, prolong the integral time ( $T_i$ ) to control vibration.

**Control short-term vibration:** If the vibration cycle is short is almost the same with the set value of derivative time ( $T_d$ ), it indicates derivative action is too strong, shorten the derivative time ( $T_d$ ) to control vibration. When derivative time ( $T_d$ ) is set to 0.00 (namely no derivative control), and there is no way to control vibration, decrease the proportional gain.

### 5.5.16 Running at wobbling frequency

Wobbling frequency is mainly applied in cases where transverse movement and winding functions are needed like textile and chemical fiber industries. The typical working process is shown as below.

| Function code                 | Name                                   | Description                                                                                                                                                                                                                                                                                                                                                                                               | Default        |

### 5.5.17 Local encoder input

The VFD supports pulse count function by inputting the count pulse from HDI high-speed pulse port. When the actual count value is no less than the set value, digital output terminal will output count-value-reached pulse signal, and the corresponding count value will be zeroed out.

| Function code | Name                                           | Description                                                                                                                                                                                   | Default |

## 5.5.18 Commissioning procedures for closed-loop control, position control and spindle positioning

### 1. Commissioning procedures for closed-loop vector control of asynchronous motor

Step 1: Restore to default value via keypad

Step 2: Set P00.03, P00.04 and P02 group motor nameplate parameters

Step 3: Motor parameter autotuning

Carry out rotary parameter autotuning or static parameter autotuning via keypad, if the motor can be disconnected from load, then it is users can carry out rotary parameter autotuning; otherwise, carry out static parameter autotuning, the parameter obtained from autotuning will be saved in P02 motor parameter group automatically.

Step 4: Verify whether the encoder is installed and set properly

a) Confirm the encoder direction and parameter setup

Set P20.01 (encoder pulse-per-revolution), set P00.00=2 and P00.10=20Hz, and run the VFD, at this point, the motor rotates at 20Hz, observe whether the speed measurement value of P18.00 is correct, if the value is negative, it indicates the encoder direction is reversed, under such situation, set P20.02 to 1; if the speed measurement value deviates greatly, it indicates P20.01 is set improperly. Observe whether P18.02 (encoder Z pulse count value) fluctuates, if yes, it indicates the encoder suffers interference or P20.01 is set improperly, requiring users to check the wiring and the shielding layer.

b) Determine Z pulse direction

Set P00.10=20Hz, and set P00.13 (running direction) to forward and reverse direction respectively to observe whether the difference value of P18.02 is less than 5, if the difference value remains to be larger than 5 after setting Z pulse reversal function of P20.02, power off and exchange phase A and phase B of the encoder, and then observe the difference between the value of P18.02 during forward and reverse rotation. Z pulse direction only affects the forward/reverse positioning precision of the spindle positioning carried out with Z pulse.

Step 5: Closed-loop vector pilot-run

Set P00.00=3, and carry out closed-loop vector control, adjust P00.10 and speed loop and current loop PI parameter in P03 group to make it run stably in the whole range.

Step 6: Flux-weakening control

Set flux-weakening regulator gain P03.26=0–8000, and observe the flux-weakening control effect. P03.22–P03.24 can be adjusted as needed.

### 2. Commissioning procedures for closed-loop vector control of synchronous motor

Step 1: Set P00.18=1, restore to default value

Step 2: Set P00.00=3 (FVC), set P00.03, P00.04, and motor nameplate parameters in P02 group.

Step 3: Set P20.01 encoder parameter.

When the encoder is resolver-type encoder, set the encoder pulse count value to (resolver pole pair number × 1024), e.g., if pole pair number is 4, set P20.01 to 4096.

Step 4: Ensure the encoder is installed and set correctly

When motor stops, observe whether P18.21 (resolver angle) fluctuates, if it fluctuates sharply, check the wiring and grounding. Rotates the motor slowly, observe whether P18.21 changes accordingly. If yes, it indicates motor is connected correctly; if the value of P18.02 keeps constant at a non-zero value after rotating for multiple circles, it indicates encoder Z signal is correct.

Step 5: Autotuning of initial position of magnetic pole

Set P20.11=2 or 3 (3: rotary autotuning; 2: static autotuning), press RUN key to run the VFD.

a) Rotary autotuning (P20.11 = 3)

Detect the position of current magnetic pole when autotuning starts, and then accelerates to 10Hz, autotuning corresponding magnetic pole position of encoder Z pulse, and decelerate to stop.

During running, if ENC1O or ENC1D fault occurred, set P20.02=1 and carry out autotuning again.

After autotuning is done, the angle obtained from autotuning will be saved in P20.09 and P20.10 automatically.

b) Static autotuning

In cases where the load can be disconnected, it is recommended to adopt rotary autotuning (P20.11=3) as it has high angle precision. If the load cannot be disconnected, users can adopt static autotuning (P20.11=2). The magnetic pole position obtained from autotuning will be saved in P20.09 and P20.10.

Step 6: Closed-loop vector pilot-run

Adjust P00.10 and speed loop and current loop PI parameter in P03 group to make it run stably in the whole range. If oscillation occurred, reduce the value of P03.00, P03.03, P03.09 and P03.10. If current oscillation noise occurred during low speed, adjust P20.05.

**Note:** It is necessary to re-determine P20.02 (encoder direction) and carry out magnetic pole position autotuning again if the wiring of motor or encoder is changed.

### 3. Commissioning procedures for pulse string control

Pulse input is operated based on closed-loop vector control; speed detection is needed in the subsequent spindle positioning, zeroing operation and division operation.

Step 1: Restore to default value by keypad

Step 2: Set P00.03, P00.04 and motor nameplate parameters in P02 group

Step 3: Motor parameter autotuning: rotary parameter autotuning or static parameter autotuning

Step 4: Verify the installation and settings of encoder. Set P00.00=3 and P00.10=20Hz to run the system, and check the control effect and performance of the system.

Step 5: Set P21.00=0001 to set positioning mode to position control, namely pulse-string control. There are four kinds of pulse command modes, which can be set by P21.01 (pulse command mode).

Under position control mode, you can check high-order bit and low-order bit of position reference and feedback, P18.02 (count value of Z pulse), P18.00 (actual frequency of encoder), P18.17 (pulse command frequency) and P18.19 (position regulator output) via P18, through which users can figure out the relation between P18.08 (position of position reference point) and P18.02, pulse command frequency P18.17, feedforward P18.18 and position regulator output P18.19.

Step 6: The position regulator has two gains, namely P21.02 and P21.03, and they can be switched by speed command, torque command and terminals.

Step 7: When P21.08 (output limit of position controller) is set to 0, the position control will be invalid, and at this point, the pulse string acts as frequency source, P21.13 (position feedforward gain) should be set to 100%, and the speed acceleration/deceleration time is determined by the acceleration /deceleration time of pulse string, the pulse string acceleration/deceleration time of the system can be adjusted. If the pulse string acts as the frequency source in speed control, users can also set P21.00 to 0000, and set the frequency source reference P00.06 or P00.07 to 12 (set by pulse string AB), at this point, the acceleration/deceleration time is determined by the acceleration/deceleration time of the VFD, meanwhile, the parameters of pulse string AB is still set by P21 group. In speed mode, the filter time of pulse string AB is determined by P21.29.

Step 8: The input frequency of pulse string is the same with the feedback frequency of encoder pulse, the relation between them can be changed by altering P21.11 (numerator of position command ratio) and P21.12 (denominator of position command ratio)

Step 9: When running command or servo enabling is valid (by setting P21.00 or terminal function 63), it will enter pulse string servo running mode.

#### 4. Commissioning procedures for spindle positioning

Spindle orientation is to realize orientation functions like zeroing and division based on closed-loop

## vector control

Step 1–4: These four steps are the same with the first four steps of the commissioning procedures for closed-loop vector control, which aim to fulfill the control requirements of closed-loop vector control, thus realizing spindle positioning function in either position control or speed control mode.

Step 5: Set P22.00.bit0=1 to enable spindle positioning, set P22.00.bit1 to select spindle zero input. If the system adopts encoder for speed measurement, set P22.00.bit1 to 0 to select Z pulse input; if the system adopts photoelectric switch for speed measurement, set P22.00.bit1 to 1 to select photoelectric switch as zero input; set P22.00.bit2 to select zero search mode, set P22.00.bit3 to enable or disable zero calibration, and select zero calibration mode by setting P22.00.bit7.

## Step 6: Spindle zeroing operation

a) Select the positioning direction by setting P22.00.bit4.

b) There are four zero positions in P22 group, users can choose one out of four zeroing positions by setting zeroing input terminal selection (46, 47) in P05 group. When executing zeroing function, the motor will stop accurately at corresponding zeroing position according to the set positioning direction, which can be viewed via P18.10.

c) The positioning length of spindle zeroing is determined by the deceleration time of accurate-stop and the speed of accurate-stop.

## Step 7: Spindle division operation

There are seven scale-division positions in P22 group, users can choose one out of seven scale-division positions by setting scale-division input terminal selection (48, 49, 50) in P05 group. Enable corresponding scale-division terminal after the motor stops accurately, and the motor will check the scale-division position state and switch to corresponding position incrementally, at this point,

users can check [P18.09](#).

Step 8: Priority level of speed control, position control and zeroing

The priority level of speed running is higher than that of the scale division, when the system runs in scale-division mode, if spindle orientation is prohibited, the motor will turn to speed mode or position mode.

The priority level of zeroing is higher than that of the scale division.

Scale-division command is valid when the scale-division terminal is from 000 state to non-000 state, e.g., in 000–011, the spindle executes scale division 3. The transition time during terminal switchover needs to be less than 10ms; otherwise, wrong scale division command may be executed.

Step 9: Hold positioning

The position loop gain during positioning is [P21.03](#); while the position loop gain in positioning-completion-hold state is [P21.02](#). In order to keep sufficient position-hold force and ensure no system oscillation occurred, adjust [P03.00](#), [P03.01](#), [P20.05](#), and [P21.02](#).

Step 10: Positioning command selection (bit6 of [P22.00](#))

Electric level signal: Positioning command (zeroing and scale division) can be executed only when there is running command or the servo is enabled.

Step 11: Spindle reference point selection (bit0 of [P22.00](#))

Encoder Z pulse positioning supports the following spindle positioning modes:

- a) The encoder is installed on the motor shaft, the motor shaft and spindle is 1:1 rigid connection;
- b) The encoder is installed on the motor shaft, the motor shaft and spindle is 1:1 belt connection;

At this point, the belt may slip during high-speed running and cause inaccurate positioning, it is recommended to install proximity switch on the spindle.

- c) The encoder is installed on the spindle, and the motor shaft is connected to the spindle with belt, the drive ratio is not necessarily 1:1.

At this point, set [P20.06](#) (speed ratio of the mounting shaft between motor and encoder), and set [P22.14](#) (spindle drive ratio) to 1. As the encoder is not installed on the motor, the control performance of closed-loop vector will be affected.

Proximity switch positioning supports the following spindle positioning modes:

- a) The encoder is installed on the motor shaft, the drive ratio between motor shaft and spindle is not necessarily 1:1;

At this point, it is required to set [P22.14](#) (spindle drive ratio).

## 5. Commissioning procedures for digital positioning

The diagram for digital positioning is shown below.

Step 1–4: These four steps are the same with the first four steps of the commissioning procedures for closed-loop vector control, which aim to fulfill the control requirements of closed-loop vector control.

Step 5: Set P21.00=0011 to enable digital positioning. Set P21.17, P21.11 and P21.12 (set positioning displacement) according to actual needs; set P21.18 and P21.19 (set positioning speed); set P21.20 and P21.21 (set acceleration/deceleration time of positioning).

Step 6: Single positioning operation

Set P21.16.bit1=0, and the motor will carry out single positioning action and stay in the positioning position according to the setup in step 5.

Step 7: Cyclic positioning operation

Set P21.16.bit1=1 to enable cyclic positioning. The cyclic positioning is divided into continuous mode and repetitive mode; users can also carry out cyclic positioning through terminal function (no. 55, enable digital positioning cycle)

## 6. Commissioning procedures for positioning of photoelectric switch

Photoelectric switch positioning is to realize positioning function based on closed-loop vector control.

Step 1–4: These four steps are the same with the first four steps of the commissioning procedures for closed-loop vector control, which aim to fulfill the control requirements of closed-loop vector control.

Step 5: Set P21.00=0021 to enable photoelectric switch positioning, the photoelectric switch signal can be connected to S8 terminal only, and set P05.08=43, meanwhile, set P21.17, P21.11 and P21.12 (set positioning displacement) based on actual needs; set P21.21 (deceleration time of positioning), however, when present running speed is too fast or the set positioning displacement is too small, the deceleration time of positioning will be invalid, and it will enter direct deceleration positioning mode.

#### Step 6: Cyclic positioning

After positioning is done, the motor will stay in current position. Users can set cyclic positioning through input terminal function selection (55: enable cyclic digital positioning) in P05 group; when the terminal receives cyclic positioning enable signal (pulse signal), the motor will continue running in the set speed as per the speed mode and re-enter positioning state after encountering photoelectric switch.

#### (7) Hold positioning

The position loop gain during positioning is P21.03; while the position loop gain in positioning-completion-hold state is P21.02. In order to keep sufficient position-hold force and ensure no system oscillation occurred, adjust P03.00, P03.01, P20.05, and P21.02.

### 5.5.19 Fault handling

The following provides fault handling information.

Related parameter list:

| Function code          | Name                | Description                                        | Default |

## 6 Function parameter list

### 6.1 What this chapter contains

This chapter lists all the function codes and corresponding description of each function code.

### 6.2 Function parameter list

The function parameters of the VFD are divided into groups by function. Among the function parameter groups, the P98 group is the analog input and output calibration group, while the P99 group contains the factory function parameters, which are user inaccessible. Each group includes several function codes (each function code identifies a function parameter). A three-level menu style is applied to function codes. For example, "P08.08" indicates the 8th function code in the P08 group.

The function group numbers correspond to the level-1 menus, the function codes correspond to the level-2 menus, and the function parameters correspond to the level-3 menus.

1. The content of the function code table is as follows:

Column 1 "Function code ": Code of the function group and parameter

Column 2 "Name": Full name of the function parameter

Column 3 "Description": Detailed description of the function parameter

Column 4 "Default": Initial value set in factory

Column 5 "Modify": Whether the function parameter can be modified, and conditions for the modification

"○" indicates that the value of the parameter can be modified when the VFD is in stopped or running state.

"◎" indicates that the value of the parameter cannot be modified when the VFD is in running state.

"●" indicates that the value of the parameter is detected and recorded, and cannot be modified.

(The VFD automatically checks and constrains the modification of parameters, which helps prevent incorrect modifications.)

2. The parameters adopt the decimal system (DEC). If the hexadecimal system is adopted, all bits are mutually independent on data during parameter editing, and the setting ranges at some bits can be hexadecimal (0–F).

3. "Default" indicates the factory setting of the function parameter. If the value of the parameter is detected or recorded, the value cannot be restored to the factory setting.

4. To better protect parameters, the VFD provides the password protection function. After a password is set (that is, P07.00 is set to a non-zero value), "0.0.0.0.0" is displayed when you press the **PRG/ESC** key to enter the function code editing interface. You need to enter the correct user password to enter the interface. For the factory parameters, you need to enter the correct factory

password to enter the interface. (You are not advised to modify the factory parameters. Incorrect parameter setting may cause operation exceptions or even damage to the VFD.) If password protection is not in locked state, you can change the password any time. You can set P07.00 to 0 to cancel the user password. When P07.00 is set to a non-zero value during power-on, parameters are prevented from being modified by using the user password function. When you modify function parameters through serial communication, the user password protection function is also applicable and compliant with the same rule.

| Function code                    | Name                                   | Description                                                                                                                                                                                                                                                                                                               | Default | Modify |

| P01.02        | Starting frequency hold time | <div></div> <p>Setting a proper starting frequency can increase the torque during VFD start. During the hold time of the starting frequency, the output frequency of the VFD is the starting frequency. And then, the VFD runs from the starting frequency to the set frequency. If the set frequency is lower than the starting frequency, the VFD stops running and keeps in the standby state. The starting frequency is not limited in the lower limit frequency.</p> <p>Setting range: 0.0–50.0s</p> | 0.0s    | ⊙      |
| P01.03        | Braking current before start | The VFD performs DC braking with the braking current before start and it speeds up after the DC braking time. If the set DC braking time is 0, DC braking is invalid.                                                                                                                                                                                                                                                                                                                                                                                                                      | 0.0%    | ⊙      |
| P01.04        | Braking time before start    | Stronger braking current indicates larger braking power. The DC braking current before start is a percentage of the VFD rated current.<br>Setting range of <u>P01.03</u> : 0.0–100.0%<br>Setting range of <u>P01.04</u> : 0.00–50.00s                                                                                                                                                                                                                                                                                                                                                      | 0.00s   | ⊙      |

| P02.26        | Overload protection selection of motor 1 | 0: No protection<br>1: Common motor protection (with low-speed compensation). As the cooling effect of a common motor is degraded at low speed running, the corresponding electronic thermal protection value needs to be adjusted properly, the low compensation indicates lowering the overload protection threshold of the motor whose running frequency is lower than 30Hz.<br>2: Variable-frequency motor protection (without low speed compensation). Because the heat dissipation function for a variable-frequency motor is not impacted by the rotation speed, it is not necessary to adjust the protection value at low speed running. | 2              | ☉      |

|               | proportional gain 1                | <p>applicable only to vector control mode. Below the switching frequency 1 (<u>P03.02</u>), the speed-loop PI parameters are: <u>P03.00</u> and <u>P03.01</u>. Above the switching frequency 2 (<u>P03.05</u>), the speed-loop PI parameters are: <u>P03.03</u> and <u>P03.04</u>. PI parameters are obtained according to the linear change of two groups of parameters. See the following figure:</p>  <p>The speed loop dynamic response characteristics of vector control can be adjusted by setting the proportional coefficient and integral time of speed regulator. Increasing proportional gain or reducing integral time can accelerate dynamic response of speed loop; however, if the proportional gain is too large or integral time is too small, system oscillation and overshoot may occur; if proportional gain is too small, stable oscillation or speed offset may occur.</p> <p>PI parameters have a close relationship with the inertia of the system. Adjust PI parameters depending on different loads to meet various demands.</p> <p>Setting range of <u>P03.00</u>: 0.0–200.0<br/>           Setting range of <u>P03.01</u>: 0.000–10.000s<br/>           Setting range of <u>P03.02</u>: 0.00Hz–<u>P03.05</u><br/>           Setting range of <u>P03.03</u>: 0.0–200.0<br/>           Setting range of <u>P03.04</u>: 0.000–10.000s<br/>           Setting range of <u>P03.05</u>: <u>P03.02</u>–<u>P00.03</u> (Max. output frequency)</p> |         |        |

| P03.23        | Lowest weakening point in constant power zone       | The function codes <u>P03.22</u> and <u>P03.23</u> are valid at constant power. The motor enters the flux-weakening state when the motor runs above the rated speed. Change the flux-weakening curvature by modifying the flux-weakening control coefficient. The larger the coefficient, the steeper the curve, the smaller the coefficient, the smoother the curve.<br>Setting range of <u>P03.22</u> : 0.1–2.0<br>Setting range of <u>P03.23</u> : 10%–100% | 20%     | ○      |

| P04.38        | Reactive current closed-loop integral time in SM V/F control | When the SM V/F control mode is enabled, the function code is used to set the integral coefficient of reactive current closed-loop control.<br>Setting range: 0–3000                                                                                                                                                                          | 30      | ○      |
| P04.39        | Reactive current closed-loop output limit in SM V/F control  | When the SM V/F control mode is enabled, the function code is used to set the output limit of the reactive current closed-loop control. A greater value indicates a higher reactive closed-loop compensation voltage and higher output power of the motor. In general, you do not need to modify the function code.<br>Setting range: 0–16000 | 8000    | ○      |

| P05.11        | Terminal control mode | <p>The function code is used to set the mode of terminal control.</p> <p>0: Two-wire control 1, the enabling consistent with the direction. This mode is widely used. The defined FWD/REV terminal command determines the motor rotation direction.</p> <div></div> <table><tr><td>FWD</td><td>REV</td><td>Running command</td></tr><tr><td>OFF</td><td>OFF</td><td>Stop</td></tr><tr><td>ON</td><td>OFF</td><td>Forward running</td></tr><tr><td>OFF</td><td>ON</td><td>Reverse running</td></tr><tr><td>ON</td><td>ON</td><td>Hold</td></tr></table> <p>1: Two-wire control 2, the enabling separated from the direction. In this mode, FWD is the enabling terminal. The direction depends on the defined REV state.</p> <div></div> <table><tr><td>FWD</td><td>REV</td><td>Running command</td></tr><tr><td>OFF</td><td>OFF</td><td>Stop</td></tr><tr><td>ON</td><td>OFF</td><td>Forward running</td></tr><tr><td>OFF</td><td>ON</td><td>Stop</td></tr><tr><td>ON</td><td>ON</td><td>Reverse running</td></tr></table> <p>2: Three-wire control 1. This mode defines Sin as the enabling terminal, and the running command is generated by FWD, while the direction is controlled by REV. During running, the Sin terminal needs to be closed, and terminal FWD generates a rising edge signal, then the VFD starts to run in the direction set by the state of terminal REV; the VFD needs to be stopped by disconnecting terminal Sin.</p> | FWD     | REV    | Running command | OFF | OFF | Stop | ON | OFF | Forward running | OFF | ON | Reverse running | ON | ON | Hold | FWD | REV | Running command | OFF | OFF | Stop | ON | OFF | Forward running | OFF | ON | Stop | ON | ON | Reverse running | 0 | ⊙ |

This mode defines Sin as the enabling terminal, and the running command is generated by FWD or REV, but the direction is controlled by both FWD and REV. During running, the Sin terminal needs to be closed, and terminal FWD or REV generates a rising edge signal to control the running and direction of the VFD; the VFD needs to be stopped by disconnecting terminal Sin.</p> | Sin               | REV    | Previous direction | Present direction | ON | OFF | Run forward | Run reversely | → ON | Run reversely | Run forward | ON | ON→ | Run reversely | Run forward | OFF | Run forward | Run reversely | ON→ | ON | Decelerate to stop |  | OFF | OFF |  |  |

| P08.50        | Magnetic flux braking                           | The function code is used to enable magnetic flux braking.<br>0: Invalid<br>100–150: A greater coefficient indicates greater braking strength.<br>The VFD can quickly slow down the motor by increasing the magnetic flux. The energy generated by the motor during braking can be transformed into heat energy by increasing the magnetic flux.<br>The VFD monitors the state of the motor continuously even during the magnetic flux period. Magnetic flux braking can be used for motor stop, as well as for motor rotation speed change. The other advantages include: Braking is performed immediately after the stop command is given. The braking can be started without waiting for magnetic flux weakening.<br>The cooling is better. The current of the stator other than the rotor increases during magnetic flux braking, while the cooling of the stator is more effective than the rotor. | 0       | ○      |

|               | time 1                             | speed-loop PI parameters are: <u>P23.00</u> and <u>P23.01</u> . Above the switching frequency 2 ( <u>P23.05</u> ), the speed-loop PI parameters are: <u>P23.03</u> and <u>P23.04</u> . PI parameters are obtained according to the linear change of two groups of parameters. See the following figure:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |        |
| P23.02        | Low-point frequency for switching  | <p>The speed loop dynamic response characteristics of vector control can be adjusted by setting the proportional coefficient and integral time of speed regulator. Increasing proportional gain or reducing integral time can accelerate dynamic response of speed loop; however, if the proportional gain is too large or integral time is too small, system oscillation and overshoot may occur; if proportional gain is too small, stable oscillation or speed offset may occur.</p> <p>PI parameters have a close relationship with the inertia of the system. Adjust PI parameters depending on different loads to meet various demands.</p> <p>Setting range of <u>P23.00</u>: 0.0–200.0<br/>           Setting range of <u>P23.01</u>: 0.000–10.000s<br/>           Setting range of <u>P23.02</u>: 0.00Hz–<u>P23.05</u><br/>           Setting range of <u>P23.03</u>: 0.0–200.0<br/>           Setting range of <u>P23.04</u>: 0.000–10.000s<br/>           Setting range of <u>P23.05</u>: <u>P23.02</u>–<u>P00.03</u> (Max. output frequency)</p> | 5.00Hz  | ○      |

## 7 Troubleshooting

### 7.1 What this chapter contains

The chapter instructs you how to reset faults and check faults history. A complete list of alarms and fault information as well as possible causes and corrective measures are presented in this chapter.

✧ Only trained and qualified professionals are allowed to carry out the work described in this chapter. Operations should be carried out according to the instructions presented in Safety precautions.

### 7.2 Indications of alarms and faults

The fault is indicated by indicators (see "Operating the VFD by keypad"). When **TRIP** indicator is on, the alarm or fault code displayed in the keypad indicates the VFD is in exception state. This chapter covers most of the alarms and faults, and their possible causes and corrective measures, if users cannot figure out the alarm or fault causes, contact local INVT office.

### 7.3 Fault reset

You can reset the VFD through the **STOP/RST** key on the keypad, digital inputs, or by cutting off the VFD power. After faults are removed, the motor can be start again.

### 7.4 Fault history

P07.27–P07.32 record the six latest fault types; P07.33–P07.40, P07.41–P07.48, and P07.49–P07.56 record the running data of the VFD when the latest three faults occurred.

### 7.5 VFD faults and solutions

When a fault occurred, handle the fault as follows.

1. When a VFD fault occurred, confirm whether keypad display is improper? If yes, contact INVT;
2. If keypad works properly, check the function codes in P07 group to confirm the corresponding fault record parameters, and determine the real state when current fault occurred through parameters;
3. Check the table below to see whether corresponding exception states exist based on the corresponding corrective measures;
4. Rule out the faults or ask for help from professionals;
5. After confirming faults are removed, reset the fault and start running.

#### 7.5.1 Details of faults and solutions

| Fault code | Fault type                             | Possible cause                                                                          | Solution                                                                     |

7.6.8 Overcurrent

7.7 Countermeasures on common interference

7.7.1 Interference on meter switches and sensors

Interference phenomenon

Pressure, temperature, displacement, and other signals of a sensor are collected and displayed by a human-machine interaction device. The values are incorrectly displayed as follows after the VFD is

started:

1. The upper or lower limit is wrongly displayed, for example, 999 or -999.
2. The display of values jumps (usually occurring on pressure transmitters).
3. The display of values is stable, but there is a large deviation, for example, the temperature is dozens of degrees higher than the common temperature (usually occurring on thermocouples).
4. A signal collected by a sensor is not displayed but functions as a drive system running feedback signal. For example, the VFD is expected to decelerate when the upper pressure limit of the compressor is reached, but in actual running, it starts to decelerate before the upper pressure limit is reached.
5. After the VFD is started, the display of all kinds of meters (such as frequency meter and current meter) that are connected to the analog output (AO) terminal of the VFD is severely affected, displaying the values incorrectly.
6. Proximity switches are used. After the VFD is started, the indicator of a proximity switch flickers, and the output level flips.

### **Solution**

1. Check and ensure that the feedback cable of the sensor is 20 cm or farther away from the motor cable.
2. Check and ensure that the ground wire of the motor is connected to the PE terminal of the VFD (if the ground wire of the motor has been connected to the ground block, you need to use a multimeter to measure and ensure that the resistance between the ground block and PE terminal is lower than 1.5  $\Omega$ ).
3. Try to add a safety capacitor of 0.1  $\mu\text{F}$  to the signal end of the feedback signal terminal of the sensor.
4. Try to add a safety capacitor of 0.1  $\mu\text{F}$  to the power end of the sensor meter (pay attention to the voltage of the power supply and the voltage endurance of the capacitor).
5. For interference on meters connected to the AO terminal of a VFD, if AO uses current signals of 0 to 20 mA, add a capacitor of 0.47  $\mu\text{F}$  between the AO and GND terminals; and if AO uses voltage signals of 0 to 10 V, add a capacitor of 0.1  $\mu\text{F}$  between the AO and GND terminals.

### **Note:**

- When a decoupling capacitor is required, add it to the terminal of the device connected to the sensor. For example, if a thermocouple is to transmit signals of 0 to 20 mA to a temperature meter, the capacitor needs to be added on the terminal of the temperature meter; if an electronic ruler is to transmit signals of 0 to 30 V to a PLC signal terminal, the capacitor needs to be added on the terminal of the PLC.
- If a large number of meters or sensors are disturbed. It is recommended that you configure an

external C2 filter on the input power end of the VFD. For models of filters, see the filter model selection section D.7.2 Filter model selection.

### 7.7.2 Interference on RS485 communication

#### Interference phenomenon

The interference described in this section on 485 communication mainly includes communication delay, synchronization failure, occasional power-off, or complete power-off that occurs after the VFD is started.

If the communication cannot be implemented properly, regardless of whether the VFD is running, the exception is not necessarily caused by interference. You can find out the causes as follows:

1. Check whether the 485 communication bus is disconnected or in poor contact.
2. Check whether the two ends of line A or B are connected reversely.
3. Check whether the communication protocol (such as the baud rate, data bits, and check bit) of the VFD is consistent with that of the upper computer.

If you are sure that communication exceptions are caused by interference, you can resolve the problem through the following measures:

1. Simple inspection.
2. Arrange the communication cables and motor cables in different cable trays.
3. In multi-VFD application scenarios, adopt the chrysanthemum connection mode to connect the communication cables between VFDs, which can improve the anti-interference capability.
4. In multi-VFD application scenarios, check and ensure that the driving capacity of the master is sufficient.
5. In the connection of multiple VFDs, you need to configure one 120  $\Omega$  terminal resistor on each end.

#### Solution

1. Check and ensure that the ground wire of the motor is connected to the PE terminal of the VFD (if the ground wire of the motor has been connected to the ground block, you need to use a multimeter to measure and ensure that the resistance between the ground block and PE terminal is lower than 1.5  $\Omega$ ).
2. Do not connect the VFD and motor to the same ground terminal as the upper computer. It is recommended that you connect the VFD and motor to the power ground, and connect the upper computer separately to a ground stud.
3. Try to short the signal reference ground terminal (GND) of the VFD with that of the upper computer controller to ensure that ground potential of the communication chip on the control board of the VFD is consistent with that of the communication chip of the upper computer.
4. Try to short GND of the VFD to its ground terminal (PE).

Try to add a safety capacitor of 0.1  $\mu\text{F}$  on the power terminal of the upper computer (PLC, HMI, and touch screen). During this process, pay attention to the voltage of the power supply and the voltage endurance capability of the capacitor. Alternatively, you can use a magnet ring (Fe-based nanocrystalline magnet rings are recommended). Put the power L/N line or +/- line of the upper computer through the magnet ring in the same direction and wind 8 coils around the magnet ring.

### 7.7.3 Stop failure and indicator shimmering due to motor cable coupling

#### Interference phenomenon

##### 1. Stop failure

In a VFD system where an S terminal is used to control the start and stop, the motor cable and control cable are arranged in the same cable tray. After the system is started properly, the S terminal cannot be used to stop the VFD.

##### 2. Indicator shimmering

After a VFD is started, the relay indicator, power distribution box indicator, PLC indicator, and indication buzzer shimmers, blinks, or emits unusual sounds unexpectedly.

#### Solution

1. Check and ensure that the exception signal cable is arranged 20 cm or farther away from the motor cable.
2. Add a safety capacitor of 0.1  $\mu\text{F}$  between the digital input terminal (S) and the COM terminal.
3. Connect the digital input terminal (S) that controls the start and stop to other idle digital input terminals in parallel. For example, if S1 is used to control the start and stop and S4 is idle, you can try to connect S1 to S4 in parallel.

**Note:** If the controller (such as PLC) in the system controls more than 5 VFDs at the same time through digital input terminals (S), this scheme is not applicable.

### 7.7.4 Leakage current and interference on RCD

The VFD outputs high-frequency PWM voltage to drive motors. In this process, the distributed capacitance between the internal IGBT of the VFD and the heat sink and that between the stator and rotor of a motor may inevitably cause the VFD to generate high-frequency leakage current to the ground. A residual current operated protective device (RCD) is used to detect the power-frequency leakage current when a grounding fault occurs on a circuit. The application of the VFD may cause misoperation of a RCD.

##### 1. Rules for selecting RCDs

- (1) VFD systems are special. In these systems, it is required that the rated residual current of common RCDs at all levels is larger than 200 mA, and the VFDs are grounded reliably.
- (2) For RCDs, the time limit of an action needs to be longer than that of a next action, and the time

difference between two actions need to be longer than 20 ms. For example, 1s, 0.5s, and 0.2s.

- (3) For circuits in VFD systems, electromagnetic RCDs are recommended. Electromagnetic RCDs have strong anti-interference capability, and thus can prevent the impact of high-frequency leakage current.

| Electronic RCD                                                                                                                                         | Electromagnetic RCD                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Low cost, high sensitivity, small in volume, susceptible to voltage fluctuation of the grid and ambient temperature, weak anti-interference capability | Requiring highly sensitive, accurate, and stable zero-phase sequence current transformer, using permalloy high-permeability materials, complex process, high cost, not susceptible to voltage fluctuation of the power supply and ambient temperature, strong anti- interference capability |

## 2. Solution to RCD misoperation (handling the VFD)

1. Try to remove the jumper cap at "EMC/J10" on the middle casing of the VFD.
2. Try to reduce the carrier frequency to 1.5 kHz (P00.14=1.5).
3. Try to modify the modulation mode to "3PH modulation and 2PH modulation" (P08.40=0).

## 3. Solution to RCD misoperation (handling the system power distribution)

- (1) Check and ensure that the power cable is not soaking in water.
- (2) Check and ensure that the cables are not damaged or spliced.
- (3) Check and ensure that no secondary grounding is performed on the neutral wire.
- (4) Check and ensure that the main power cable terminal is in good contact with the air switch or contactor (all screws are tightened).
- (5) Check 1PH powered devices, and ensure that no earth lines are used as neutral wires by these devices.

Do not use shielded cables as VFD power cables and motor cables.

### 7.7.5 Live device chassis

After the VFD is started, there is sensible voltage on the chassis, and you may feel an electric shock when touching the chassis. The chassis, however, is not live (or the voltage is far lower than the human safety voltage) when the VFD is powered on but not running.

#### Solution

1. If there is power distribution grounding or ground stud on the site, ground the cabinet chassis of the drive system through the power ground or stud.

If there is no grounding on the site, you need to connect the motor chassis to the ground terminal PE of the VFD, and ensure that the jumper at "EMC/J10" on the middle casing of the VFD is shorted.

## 8 Maintenance

### 8.1 What this chapter contains

This chapter describes how to carry out preventive maintenance on the VFD.

### 8.2 Periodical inspection

Only little maintenance is required when the VFD is installed in an environment that meets the requirements. The following table describes the routine maintenance periods recommended by INVT.

| Subject             |        | Item                                                                                                                              | Method                                                  | Criterion                                                                                                |
|---------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Ambient environment |        | Check the temperature, and humidity, and whether there is vibration, dust, gas, oil spray, and water droplets in the environment. | Visual inspection, and use instruments for measurement. | The requirements stated in this manual are met.                                                          |
|                     |        | Check whether there are foreign matters, such as tools, or dangerous substances placed nearby.                                    | Visual inspection                                       | There are no tools or dangerous substances placed nearby.                                                |
| Voltage             |        | Check the voltage of the main circuit and control circuit.                                                                        | Use multimeters or other instruments for measurement.   | The requirements stated in this manual are met.                                                          |
| Keypad              |        | Check the display of information.                                                                                                 | Visual inspection                                       | The characters are displayed properly.                                                                   |
|                     |        | Check whether characters are not completely displayed.                                                                            | Visual inspection                                       | The requirements stated in this manual are met.                                                          |
| Main circuit        | Common | Check whether the bolts loose or come off.                                                                                        | Screw them up.                                          | No exception occurs.                                                                                     |
|                     |        | Check whether the machine is deformed, cracked, or damaged, or their color changes due to overheating and aging.                  | Visual inspection                                       | No exception occurs.                                                                                     |
|                     |        | Check whether there are stains and dust attached.                                                                                 | Visual inspection                                       | No exception occurs.<br><b>Note:</b><br>Discoloration of copper bars does not mean that they cannot work |

| Subject |                               | Item                                                                                      | Method                                                                                                           | Criterion                                                 |
|---------|-------------------------------|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
|         |                               |                                                                                           |                                                                                                                  | properly.                                                 |
|         | Conductor and wire            | Check whether the conductors are deformed or their color change due to overheat.          | Visual inspection                                                                                                | No exception occurs.                                      |
|         |                               | Check whether the wire sheaths are cracked or their color changes.                        | Visual inspection                                                                                                | No exception occurs.                                      |
|         | Terminal block                | Check whether there is damage.                                                            | Visual inspection                                                                                                | No exception occurs.                                      |
|         | Filter capacitor              | Check whether there is electrolyte leakage, discoloration, cracks, and chassis expansion. | Visual inspection                                                                                                | No exception occurs.                                      |
|         |                               | Check whether the safety valves are released.                                             | Determine the service life based on the maintenance information, or measure them through electrostatic capacity. | No exception occurs.                                      |
|         |                               | Check whether the electrostatic capacity is measured as required.                         | Use instruments to measure the capacity.                                                                         | Electrostatic capacity $\geq$ initial value $\times 0.85$ |
|         | Resistor                      | Check whether there is displacement caused due to overheat.                               | Olfactory and visual inspection                                                                                  | No exception occurs.                                      |
|         |                               | Check whether the resistors are disconnected.                                             | Visual inspection, or remove one end of the connection cable and use a multimeter for measurement.               | Resistance range: $\pm 10\%$ (of the standard resistance) |
|         | Transformer and reactor       | Check whether there is unusual vibration sounds or smells.                                | Auditory, olfactory, and visual inspection                                                                       | No exception occurs.                                      |
|         | Electromagnetic contactor and | Check whether there are vibration sounds in the                                           | Auditory inspection                                                                                              | No exception occurs.                                      |

| Subject         |                        | Item                                                                                                         | Method                                                                                  | Criterion               |
|-----------------|------------------------|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|-------------------------|
|                 | relay                  | workshop.                                                                                                    |                                                                                         |                         |
|                 |                        | Check whether the contacts are in good contact.                                                              | Visual inspection                                                                       | No exception occurs.    |
| Control circuit | Control PCB, connector | Check whether the screws and connectors loose.                                                               | Screw them up.                                                                          | No exception occurs.    |
|                 |                        | Check whether there is unusual smell or discoloration.                                                       | Olfactory and visual inspection                                                         | No exception occurs.    |
|                 |                        | Check whether there are cracks, damage, deformation, or rust.                                                | Visual inspection                                                                       | No exception occurs.    |
|                 |                        | Check whether there is electrolyte leakage or deformation.                                                   | Visual inspection, and determine the service life based on the maintenance information. | No exception occurs.    |
| Cooling system  | Cooling fan            | Check whether there are unusual sounds or vibration.                                                         | Auditory and visual inspection, and turn the fan blades with your hand.                 | The rotation is smooth. |
|                 |                        | Check whether the bolts loose.                                                                               | Screw them up.                                                                          | No exception occurs.    |
|                 |                        | Check whether there is discoloration caused due to overheat.                                                 | Visual inspection, and determine the service life based on the maintenance information. | No exception occurs.    |
|                 | Ventilation duct       | Check whether there are foreign matters blocking or attached to the cooling fan, air inlets, or air outlets. | Visual inspection                                                                       | No exception occurs.    |
|                 |                        |                                                                                                              |                                                                                         |                         |

For more details about maintenance, contact the local INVT office, or visit our website [www.invt.com](http://www.invt.com), and choose **Service and Support > Online Service**.

### 8.3 Cooling fan

The service life of the cooling fan of the VFD is more than 25,000 hours. The actual service life of the cooling fan is related to the use of the VFD and the temperature in the ambient environment.

You can view the running duration of the VFD through [P07.14](#) (Accumulated running time).

The increase of the bearing noise indicates a fan fault. If the VFD is applied in a key position, replace the fan once the fan starts to generate unusual noise. You can purchase spare parts of fans from INVT.

### Cooling fan replacement

✧ Read the safety precautions carefully and follow the instructions to perform operations. Otherwise, physical injuries or damage to the device may be caused.

1. Stop the device, disconnect the AC power supply, and wait for a time no shorter than the waiting time designated on the VFD.
2. Open the cable clamp to loosen the fan cable (for 1.5–30kW VFD models, the middle casing needs to be removed).
3. Remove the fan cable.
4. Remove the fan with a screwdriver.
5. Install a new fan in the VFD in the reverse steps. Assemble the VFD. Ensure that the air direction of the fan is consistent with that of the VFD, as shown in the following figure.

Figure 8.1 Fan maintenance for 7R5G/011P and higher models

6. Power on the VFD.

## 8.4 Capacitor

### 8.4.1 Capacitor reforming

If the VFD has been left unused for a long time, you need to follow the instructions to reform the DC bus capacitor before using it. The storage time is calculated from the date the VFD is delivered.

| Storage time      | Operation instruction                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Less than 1 year  | No charging operation is required.                                                                                                                                                                                                                                                      |
| 1 to 2 years      | The VFD needs to be powered on for 1 hour before the first running command.                                                                                                                                                                                                             |
| 2 to 3 years      | Use a voltage controlled power supply to charge the VFD:<br>Charge the VFD at 25% of the rated voltage for 30 minutes, and then charge it at 50% of the rated voltage for 30 minutes, at 75% for another 30 minutes, and finally charge it at 100% of the rated voltage for 30 minutes. |
| More than 3 years | Use a voltage controlled power supply to charge the VFD:<br>Charge the VFD at 25% of the rated voltage for 2 hours, and then charge it at 50% of the rated voltage for 2 hours, at 75% for another 2 hours, and finally charge it at 100% of the rated voltage for 2 hours.             |

The method for using a voltage controlled power supply to charge the VFD is described as follows:

The selection of a voltage controlled power supply depends on the power supply of the VFD. For VFDs with an incoming voltage of 1PH/3PH 230 V AC, you can use a 230 V AC/2 A voltage regulator. Both 1PH and 3PH VFDs can be charged with a 1PH voltage controlled power supply (connect L+ to R, and N to S or T). All the DC bus capacitors share one rectifier, and therefore they are all charged.

For VFDs of a high voltage class, ensure that the voltage requirement (for example, 380 V) is met during charging. Capacitor charging requires little current, and therefore you can use a small-capacity power supply (2 A is sufficient).

The method for using a resistor (incandescent lamp) to charge the drive is described as follows:

If you directly connect the drive device to a power supply to charge the DC bus capacitor, it needs to be charged for a minimum of 60 minutes. The charging operation must be performed at a normal indoor temperature without load, and you must connect a resistor in series mode in the 3PH circuit of the power supply.

For a 380 V drive device, use a resistor of 1 k $\Omega$ /100W. If the voltage of the power supply is no higher than 380 V, you can also use an incandescent lamp of 100W. If an incandescent lamp is used, it may go off or the light may become very weak.

Figure 8.2 Charging circuit example of driving devices

8.4.2 Electrolytic capacitor replacement

✧ Read the safety precautions carefully and follow the instructions to perform operations. Otherwise, physical injuries or damage to the device may be caused.

The electrolytic capacitor of the VFD must be replaced if it has been used for more than 35,000 hours. For details about the replacement, contact the local INVT office.

8.5 Power cable

✧ Read the safety precautions carefully and follow the instructions to perform operations. Otherwise, physical injuries or device damage may be caused.

1. Stop the VFD, disconnect the power supply, and wait for a time no shorter than the waiting time designated on the VFD.
2. Check the connection of the power cables. Ensure that they are firmly connected.
3. Power on the VFD.

## 9 Communication

### 9.1 What this chapter contains

This chapter describes the communication protocols supported by the VFD.

The VFD provides RS485 communication interfaces and adopts the master/slave communication based on the international standard Modbus communication protocol. You can implement centralized control (setting commands for controlling the VFD, modifying the running frequency and related function parameters, and monitoring the running status and fault information of the VFD) through PC/PLC, upper control computers, or other devices to meet specific application requirements.

### 9.2 Modbus protocol introduction

Modbus is a software protocol, a common language used in electronic controllers. By using this protocol, a controller can communicate with other devices through transmission lines. It is a general industrial standard. With this standard, control devices produced by different manufacturers can be connected to form an industrial network and be monitored in a centralized way.

The Modbus protocol provides two transmission modes, namely American Standard Code for Information Interchange (ASCII) and Remote Terminal Unit (RTU). On one Modbus network, all the devices must be consistent in transmission modes, baud rates, data bits, check bits, stop bits, and other basic parameters.

A Modbus network is a control network with one master and multiple slaves, that is, on one Modbus network, there is only one device serving as the master, and other devices are the slaves. The master can communicate with one slave or all the slaves by sending broadcast messages. For separate access commands, a slave needs to return a response. For broadcast messages, slaves do not need to return responses.

### 9.3 Application

The VFD uses the Modbus RTU mode and communicates through RS485 interfaces.

#### 9.3.1 RS485

RS485 interfaces work in half-duplex mode and send data signals in the differential transmission way, which is also referred to as balanced transmission. An RS485 interface uses a twisted pair, in which one wire is defined as A (+), and the other B (-). Generally, if the positive electrical level between the transmission drives A and B ranges from +2 V to +6 V, the logic is "1"; and if it ranges from -2 V to -6 V, the logic is "0". On the VFD terminal block, the 485+ terminal corresponds to A, and 485- corresponds to B.

The communication baud rate ([P14.01](#)) indicates the number of bits sent in a second, and the unit is bit/s (bps). A higher baud rate indicates faster transmission and poorer anti-interference capability. When a twisted pair of 0.56mm (24 AWG) is used, the maximum transmission distance varies according to the baud rate, as described in the following table.

| Baud rate (bps) | Max. transmission distance (meter) | Baud rate (bps) | Max. transmission distance (meter) |
|-----------------|------------------------------------|-----------------|------------------------------------|
| 2400BPS         | 1800m                              | 9600BPS         | 800m                               |
| 4800BPS         | 1200m                              | 19200BPS        | 600m                               |

When RS485 interfaces are used for long-distance communication, it is recommended that you use shielded cables, and use the shielding layer as the ground wires.

When there are fewer devices and the transmission distance is short, the whole network works well without terminal load resistors. The performance, however, degrades as the distance increases. Therefore, it is recommended that you use a 120Ω terminal resistor when the transmission distance is long.

9.3.1.1 When one VFD is used

Figure 9.1 is the Modbus wiring diagram for the network with one VFD and PC. Generally, PCs do not provide RS485 interfaces, and therefore you need to convert an RS232 or USB interface of a PC to an RS485 interface through a converter. Then, connect end A of the RS485 interface to the 485+ port on the terminal block of the VFD, and connect end B to the 485- port. It is recommended that you use shielded twisted pairs. When an RS232-RS485 converter is used, the cable used to connect the RS232 interface of the PC and the converter cannot be longer than 15 m. Use a short cable when possible. It is recommended that you insert the converter directly into the PC. Similarly, when a USB-RS485 converter is used, use a short cable when possible.

When the wiring is completed, select the correct port (for example, COM1 to connect to the RS232-RS485 converter) for the upper computer of the PC, and keep the settings of basic parameters such as communication baud rate and data check bit consistent with those of the VFD.

Figure 9.1 RS485 wiring diagram for the network with one VFD

9.3.1.2 When multiple VFDs are used

In the network with multiple VFDs, chrysanthemum connection and star connection are commonly used.

According to the requirements of the RS485 industrial bus standards, all the devices need to be connected in chrysanthemum mode with one 120 Ω terminal resistor on each end, as shown in Figure 9.2. Figure 9.3 is the simplified wiring diagram, and Figure 9.4 is the practical application diagram.

Figure 9.2 Onsite chrysanthemum connection diagram

Figure 9.3 Simplified chrysanthemum connection diagram

Figure 9.4 Practical application diagram of chrysanthemum connection

Figure 9.5 shows the start connection diagram. When this connection mode is adopted, the two devices that are farthest away from each other on the line must be connected with a terminal resistor (in this figure, the two devices are devices 1# and 15#).

Figure 9.5 Star connection

Use shielded cables, if possible, in multi-VFD connection. The baud rates, data bit check settings, and other basic parameters of all the devices on the RS485 line must be set consistently, and addresses cannot be repeated.

9.3.2 RTU

9.3.2.1 RTU communication frame structure

When a controller is set to use the RTU communication mode on a Modbus network, every byte (8 bits) in the message includes 2 hexadecimal characters (each includes 4 bits). Compared with the ASCII mode, the RTU mode can help to send more data at the same baud rate.

Code system

- 1 start bit
- 7 or 8 data bits; the minimum valid bit is sent first. Each frame domain of 8 bits includes 2 hexadecimal characters (0–9, A–F).
- 1 odd/even check bit; this bit is not provided if no check is needed.
- 1 stop bit (with check performed), or 2 bits (without check)

Error detection domain

- Cyclic redundancy check (CRC)

The following table describes the data format.

11-bit character frame (Bits 1 to 8 are data bits)

|           |      |      |      |      |      |      |      |      |           |          |
|-----------|------|------|------|------|------|------|------|------|-----------|----------|
| Start bit | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | BIT8 | Check bit | Stop bit |
|-----------|------|------|------|------|------|------|------|------|-----------|----------|

10-bit character frame (Bits 1 to 7 are data bits)

|           |      |      |      |      |      |      |      |           |          |
|-----------|------|------|------|------|------|------|------|-----------|----------|
| Start bit | BIT1 | BIT2 | BIT3 | BIT4 | BIT5 | BIT6 | BIT7 | Check bit | Stop bit |
|-----------|------|------|------|------|------|------|------|-----------|----------|

In a character frame, only the data bits carry information. The start bit, check bit, and stop bit are used

to facilitate the transmission of the data bits to the destination device. In practical applications, you must set the data bits, parity check bits, and stop bits consistently.

In RTU mode, a new frame always must be preceded by a time gap with a minimum length of 3.5 bytes. On a network where the transmission rate is calculated based on the baud rate, the transmission time of 3.5 bytes can be easily obtained. After the idle time ends, the data domains are sent in the following sequence: slave address, operation command code, data, and CRC check character. Each byte sent in each domain includes hexadecimal characters (0–9, A–F). The network devices always monitor the communication bus. After receiving the first domain (address information), each network device identifies the byte. After the last byte is sent, a similar transmission interval (with a minimum length of 3.5 bytes) is used to indicate that the frame transmission ends. Then, the transmission of a new frame starts.

The information of a frame must be sent in a continuous data flow. If there is an interval greater than the transmission time of 1.5 bytes before the transmission of the entire frame is complete, the receiving device deletes the incomplete information, and mistakes the subsequent byte for the address domain of a new frame. Similarly, if the transmission interval between two frames is shorter than the transmission time of 3.5 bytes, the receiving device mistakes it for the data of the last frame. The CRC check value is incorrect due to the disorder of the frames, and thus a communication fault occurs.

The following table describes the standard structure of an RTU frame.

|                                              |                                                                                             |
|----------------------------------------------|---------------------------------------------------------------------------------------------|
| START (frame header)                         | T1-T2-T3-T4(transmission time of 3.5 bytes)                                                 |
| ADDR (slave address domain)                  | Communication address: 0–247 (in decimal system) (0 indicates the broadcast address)        |
| CMD (function domain)                        | 03H: read slave parameters<br>06H: write slave parameters                                   |
| (Data domain)<br>DATA(N-1)<br>...<br>DATA(0) | Data of 2*N bytes, main content of the communication as well as the core of data exchanging |
| CRC CHK low-order bits                       | Detection value: CRC (16 bits)                                                              |
| CRC CHK high-order bits                      |                                                                                             |
| END (frame tail)                             | T1-T2-T3-T4 (transmission time of 3.5 bytes)                                                |

9.3.2.2 RTU communication frame error check modes

During the transmission of data, errors may occur due to various factors. Without check, the data

receiving device cannot identify data errors and may make a wrong response. The wrong response may cause severe problems. Therefore, the data must be checked.

The check is implemented as follows: The transmitter calculates the to-be-transmitted data based on a specific algorithm to obtain a result, adds the result to the rear of the message, and transmits them together. After receiving the message, the receiver calculates the data based on the same algorithm to obtain a result, and compares the result with that transmitted by the transmitter. If the results are the same, the message is correct. Otherwise, the message is considered wrong.

The error check of a frame includes two parts, namely, bit check on individual bytes (that is, odd/even check using the check bit in the character frame), and whole data check (CRC check).

#### **Bit check on individual bytes (odd/even check)**

You can select the bit check mode as required, or you can choose not to perform the check, which will affect the check bit setting of each byte.

Definition of even check: Before the data is transmitted, an even check bit is added to indicate whether the number of "1" in the to-be-transmitted data is odd or even. If it is even, the check bit is set to "0"; and if it is odd, the check bit is set to "1".

Definition of odd check: Before the data is transmitted, an odd check bit is added to indicate whether the number of "1" in the to-be-transmitted data is odd or even. If it is odd, the check bit is set to "0"; and if it is even, the check bit is set to "1".

For example, the data bits to be transmitted are "11001110", including five "1". If the even check is applied, the even check bit is set to "1"; and if the odd check is applied, the odd check bit is set to "0". During the transmission of the data, the odd/even check bit is calculated and placed in the check bit of the frame. The receiving device performs the odd/even check after receiving the data. If it finds that the odd/even parity of the data is inconsistent with the preset information, it determines that a communication error occurs.

#### **Cyclical Redundancy Check (CRC) method**

A frame in the RTU format includes an error detection domain based on the CRC calculation. The CRC domain checks all the content of the frame. The CRC domain consists of two bytes, including 16 binary bits. It is calculated by the transmitter and added to the frame. The receiver calculates the CRC of the received frame, and compares the result with the value in the received CRC domain. If the two CRC values are not equal to each other, errors occur in the transmission.

During CRC, 0xFFFF is stored first, and then a process is invoked to process a minimum of 6 contiguous bytes in the frame based on the content in the current register. CRC is valid only for the 8-bit data in each character. It is invalid for the start, end, and check bits.

During the generation of the CRC values, the "exclusive or" (XOR) operation is performed on the each 8-bit character and the content in the register. The result is placed in the bits from the low-order bit to the high-order bit, and 0 is placed in the high-order bit. Then, the low-order bit is detected. If the low-order bit is 1, the XOR operation is performed on the current value in the register and the preset

value. If low-order bit is 0, no operation is performed. This process is repeated 8 times. After the last bit (8th bit) is detected and processed, the XOR operation is performed on the next 8-bit byte and the current content in the register. The final values in the register are the CRC values obtained after operations are performed on all the bytes in the frame.

The calculation adopts the international standard CRC check rule. You can refer to the related standard CRC algorithm to compile the CRC calculation program as required.

The following example is a simple CRC calculation function for your reference (using the C programming language):

```
unsigned int  crc_cal_value(unsigned char*data_value,unsigned char
data_length)
{
    int i;
    unsigned int crc_value=0xffff;
    while(data_length--)
    {
        crc_value^=*data_value++;
        for(i=0;i<8;i++)
        {
            if(crc_value&0x0001)
                crc_value=(crc_value>>1)^0xa001;
            else
                crc_value=crc_value>>1;
        }
    }
    return(crc_value);
}
```

In the ladder logic, CKSM uses the table look-up method to calculate the CRC value according to the content in the frame. The program of this method is simple, and the calculation is fast, but the ROM space occupied is large. Use this program with caution in scenarios where there are space occupation requirements on programs.

## 9.4 RTU command code and communication data

### 9.4.1 Command code 03H, reading N words (continuously up to 16 words)

The command code 03H is used by the master to read data from the VFD. The count of data to be read depends on the "data count" in the command. A maximum of 16 pieces of data can be read. The addresses of the read parameters must be contiguous. Each piece of data occupies 2 bytes, that is, one word. The command format is presented using the hexadecimal system (a number followed by "H" indicates a hexadecimal value). One hexadecimal value occupies one byte.

For example, starting from the data address of 0004H, to read two contiguous pieces of data (that is,

to read content from the data addresses 0004H and 0005H) of the VFD whose address is 01H, the frame structures are described in the following.

RTU master command (sent from the master to the VFD):

|                              |                                                        |
|------------------------------|--------------------------------------------------------|
| START                        | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR (address)               | 01H                                                    |
| CMD (command code)           | 03H                                                    |
| Start address high-order bit | 00H                                                    |
| Start address low-order bit  | 04H                                                    |
| Data count high-order bit    | 00H                                                    |
| Data count low-order bit     | 02H                                                    |
| CRC low-order bit            | 85H                                                    |
| CRC high-order bit           | CAH                                                    |
| END                          | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

"START" and "END" are "T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes)", indicating that a time gap with a minimum length of 3.5 bytes must be kept before RS485 communication is executed. The time gap is used to distinguish one message from another so that the two messages are not regarded as one message.

"ADDR" is "01H", indicating that the command is sent to the VFD whose address is 01H. The ADDR information occupies one byte.

"CMD" is "03H", indicating that the command is used to read data from the VFD. The CMD information occupies one byte.

"Start address" indicates that data reading is started from this address. It occupies two bytes, with the high-order bit on the left and low-order bit on the right.

"Data count" indicates the count of data to be read (unit: word). "Start address" is "0004H" and "Data count" is 0002H, indicating that data is to be read from the data addresses of 0004H and 0005H.

CRC check occupies two bytes, with the low-order bit on the left and high-order bit on the right.

RTU slave response (sent from the VFD to the master):

|                                 |                                                        |
|---------------------------------|--------------------------------------------------------|
| START                           | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR                            | 01H                                                    |
| CMD                             | 03H                                                    |
| High-order bit of data in 0004H | 04H                                                    |
| Low-order bit of data in 0004H  | 13H                                                    |
| High-order bit of data in 0005H | 88H                                                    |
| Low-order bit of data in 0005H  | 00H                                                    |
| CRC low-order bits              | 00H                                                    |

|                                 |                                                        |
|---------------------------------|--------------------------------------------------------|
| CRC high-order bits             | 7EH                                                    |
| High-order bit of data in 0004H | 9DH                                                    |
| END                             | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

The definition of the response information is described as follows:

"ADDR" is "01H", indicating that the message is sent from the VFD whose address is 01H. The ADDR information occupies one byte.

"CMD" is "03H", indicating that the message is a VFD response to the 03H command from the master for reading data. The CMD information occupies one byte.

"Number of bytes" indicates the number of bytes between a byte (not included) and the CRC byte (not included). The value "04" indicates that there are four bytes of data between "Number of bytes" and "CRC low-order bit", that is, "High-order bit of data in 0004H", "Low-order bit of data in 0004H", "High-order bit of data in 0005H", and "Low-order of data in 0005H".

A piece of data is two bytes, with the high-order bits on the left and low-order bit on the right. From the response, the data in 0004H is 1388H, and that in 0005H is 0000H.

CRC check occupies two bytes, with the low-order bit on the left and high-order bit on the right.

#### 9.4.2 Command word 06H, writing a word

This command is used by the master to write data to the VFD. One command can be used to write only one piece of data. It is used to modify the parameters and running mode of the VFD. For example, to write 5000 (1388H) to 0004H of the VFD whose address is 02H, the frame structures are described in the following.

RTU master command (sent from the master to the VFD):

|                                        |                                                        |
|----------------------------------------|--------------------------------------------------------|
| START                                  | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR                                   | 02H                                                    |
| CMD                                    | 06H                                                    |
| High-order bit of data writing address | 00H                                                    |
| Low-order bit of data writing address  | 04H                                                    |
| Data content high-order bit            | 13H                                                    |
| Data content low-order bit             | 88H                                                    |
| CRC low-order bit                      | C5H                                                    |
| CRC high-order bit                     | 6EH                                                    |
| END                                    | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

RTU slave response (sent from the VFD to the master):

|                                        |                                                        |
|----------------------------------------|--------------------------------------------------------|
| START                                  | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR                                   | 02H                                                    |
| CMD                                    | 06H                                                    |
| High-order bit of data writing address | 00H                                                    |
| Low-order bit of data writing address  | 04H                                                    |
| Data content high-order bit            | 13H                                                    |
| Data content low-order bit             | 88H                                                    |
| CRC low-order bit                      | C5H                                                    |
| CRC high-order bit                     | 6EH                                                    |
| END                                    | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

Note: Sections 9.4.1 and 9.4.2 mainly describe the command formats. For the detailed application, see section 9.4.8.

#### 9.4.3 Command code 08H, diagnosis

Sub-function code description:

| Sub-function code | Description                         |
|-------------------|-------------------------------------|
| 0000              | Return data based on query requests |

For example, to query about the circuit detection information about the VFD whose address is 01H, the query and return strings are the same, and the formats are described in the following tables.

RTU master command:

|                                  |                                                        |
|----------------------------------|--------------------------------------------------------|
| START                            | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR                             | 01H                                                    |
| CMD                              | 08H                                                    |
| Sub-function code high-order bit | 00H                                                    |
| Sub-function code low-order bit  | 00H                                                    |
| Data content high-order bit      | 12H                                                    |
| Data content low-order bit       | ABH                                                    |
| CRC CHK low-order bit            | ADH                                                    |
| CRC CHK high-order bit           | 14H                                                    |
| END                              | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

RTU slave response:

|                                  |                                                        |
|----------------------------------|--------------------------------------------------------|
| START                            | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR                             | 01H                                                    |
| CMD                              | 08H                                                    |
| Sub-function code high-order bit | 00H                                                    |
| Sub-function code low-order bit  | 00H                                                    |
| Data content high-order bit      | 12H                                                    |
| Data content low-order bit       | ABH                                                    |
| CRC CHK low-order bit            | ADH                                                    |
| CRC CHK high-order bit           | 14H                                                    |
| END                              | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

#### 9.4.4 Command code 10H, continuous writing

The command code 10H is used by the master to write data to the VFD. The quantity of data to be written is determined by "Data count", and a maximum of 16 pieces of data can be written.

For example, to write 5000 (1388H) and 50 (0032H) respectively to 0004H and 0005H of the VFD whose slave address is 02H, the frame structures are described in the following.

RTU master command (sent from the master to the VFD):

|                                        |                                                        |
|----------------------------------------|--------------------------------------------------------|
| START                                  | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR                                   | 02H                                                    |
| CMD                                    | 10H                                                    |
| High-order bit of data writing address | 00H                                                    |
| Low-order bit of data writing address  | 04H                                                    |
| Data count high-order bit              | 00H                                                    |
| Data count low-order bit               | 02H                                                    |
| Number of bytes                        | 04H                                                    |
| Content high-order bit of 0004H        | 13H                                                    |
| Content low-order bit of 0004H         | 88H                                                    |
| Content high-order bit of 0005H        | 00H                                                    |
| Content low-order bit of 0005H         | 32H                                                    |
| CRC low-order bit                      | C5H                                                    |
| CRC high-order bit                     | 6EH                                                    |
| END                                    | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

RTU slave response (sent from the VFD to the master)

|                                        |                                                        |
|----------------------------------------|--------------------------------------------------------|
| START                                  | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |
| ADDR                                   | 02H                                                    |
| CMD                                    | 10H                                                    |
| High-order bit of data writing address | 00H                                                    |
| Low-order bit of data writing address  | 04H                                                    |
| Data count high-order bit              | 00H                                                    |
| Data count low-order bit               | 02H                                                    |
| CRC low-order bit                      | C5H                                                    |
| CRC high-order bit                     | 6EH                                                    |
| END                                    | T1-T2-T3-T4 (time gap with a min. length of 3.5 bytes) |

#### 9.4.5 Data address definition

This section describes the address definition of communication data. The addresses are used for controlling the running, obtaining the status information, and setting function parameters of the VFD.

##### 9.4.5.1 Function code address format rules

The address of a function code consists of two bytes, with the high-order bit on the left and low-order bit on the right. The high-order bit ranges from 00 to ffH, and the low-order bit also ranges from 00 to ffH. The high-order bit is the hexadecimal form of the group number before the dot mark, and low-order bit is that of the number behind the dot mark. Take P05.06 as an example: The group number is 05, that is, the high-order bit of the parameter address is the hexadecimal form of 05; and the number behind the dot mark is 06, that is, the low-order bit is the hexadecimal form of 06. Therefore, the function code address is 0506H in the hexadecimal form. For example, the parameter address of P10.01 is 0A01H.

| Function code | Name                        | Description                                                                                                | Setting range | Default | Modify                |
|---------------|-----------------------------|------------------------------------------------------------------------------------------------------------|---------------|---------|-----------------------|
| <u>P10.00</u> | Simple PLC mode             | 0: Stop after running once<br>1: Keep running with the final value after running once<br>2: Cyclic running | 0–2           | 0       | <input type="radio"/> |
| <u>P10.01</u> | Simple PLC memory selection | 0: Without memory after power-off<br>1: With memory after power-off                                        | 0–1           | 0       | <input type="radio"/> |

#### Note:

- The parameters in the P99 group are set by the manufacturer and cannot be read or modified.

Some parameters cannot be modified when the VFD is running; some cannot be modified regardless of the VFD status. Pay attention to the setting range, unit, and description of a parameter when modifying it.

- The service life of the Electrically Erasable Programmable Read-Only Memory (EEPROM) may be reduced if it is frequently used for storage. Some function codes do not need to be stored during communication. The application requirements can be met by modifying the value of the on-chip RAM, that is, modifying the MSB of the corresponding function code address from 0 to 1. For example, if P00.07 is not to be stored in the EEPROM, you need only to modify the value in the RAM, that is, set the address to 8007H. The address can be used only for writing data to the on-chip RAM, and it is invalid when used for reading data.

#### 9.4.5.2 Description of other function addresses

In addition to modifying the parameters of the VFD, the master can also control the VFD, such as starting and stopping it, and monitoring the operation status of the VFD. The following table describes other function parameters.

| Function                            | Address | Data description                                                                        | R/W |
|-------------------------------------|---------|-----------------------------------------------------------------------------------------|-----|
| Communication-based control command | 2000H   | 0001H: Forward running                                                                  | R/W |
|                                     |         | 0002H: Reverse running                                                                  |     |
|                                     |         | 0003H: Forward jogging                                                                  |     |
|                                     |         | 0004H: Reverse jogging                                                                  |     |
|                                     |         | 0005H: Stop                                                                             |     |
|                                     |         | 0006H: Coast to stop (emergency stop)                                                   |     |
|                                     |         | 0007H: Fault reset                                                                      |     |
|                                     |         | 0008H: Jogging to stop                                                                  |     |
| Communication-based value setting   | 2001H   | Communication-based frequency setting (0–Fmax, unit: 0.01 Hz)                           | R/W |
|                                     | 2002H   | PID setting, range (0–1000, 1000 corresponding to 100.0%)                               | R/W |
|                                     | 2003H   | PID feedback, range (0–1000, 1000 corresponding to 100.0%)                              | R/W |
|                                     | 2004H   | Torque setting (-3000 – +3000, 1000 corresponding to 100.0% of the motor rated current) | R/W |
|                                     | 2005H   | Setting of the upper limit of the forward running                                       | R/W |

| Read current step of<br>multi-step speed | 3012H   | 0–15                                                           | R   |
| External length                          | 3013H   | 0–65535                                                        | R   |
| External count value                     | 3014H   | 0–65535                                                        | R   |
| Torque setting                           | 3015H   | -300.0–300.0% (Unit: 0.1%)                                     | R   |
| Identification code                      | 3016H   |                                                                | R   |
| Fault code                               | 5000H   |                                                                | R   |

The Read/Write (R/W) characteristics indicate whether a function can be read and written. For example, "Communication-based control command" can be written, and therefore the command code 6H is used to control the VFD. The R characteristic indicates that a function can only be read, and W indicates that a function can only be written.

**Note:** Some parameters in the preceding table are valid only after they are enabled. Take the running and stop operations as examples, you need to set "Running command channel" (P00.01) to

"Communication", and set "Communication running command channel" (P00.02) to the Modbus communication channel. For another example, when modifying "PID setting", you need to set "PID reference source" (P09.00) to Modbus communication.

The following table describes the encoding rules of device codes (corresponding to the identification code 2103H of the VFD).

| Eight high-order bits of code | Meaning | Eight low-order bits of code | Meaning             |
|-------------------------------|---------|------------------------------|---------------------|
| 01                            | GD      | 0x08                         | GD35 vector VFD     |
|                               |         | 0x09                         | GD35-H1 vector VFD  |
|                               |         | 0x0a                         | GD300 vector VFD    |
|                               |         | 0xa0                         | GD350 vector VFD    |
|                               |         | 0xa1                         | GD350-UL vector VFD |
|                               |         | 0xa2                         | GD350A vector VFD   |

#### 9.4.6 Fieldbus scale

In practical applications, communication data is represented in the hexadecimal form, but hexadecimal values cannot represent decimals. For example, 50.12 Hz cannot be represented in the hexadecimal form. In such cases, we can multiply 50.12 by 100 to obtain an integer 5012, and then 50.12 can be represented as 1394H (5012 in the decimal form) in the hexadecimal form.

In the process of multiplying a non-integer by a multiple to obtain an integer, the multiple is referred to as a fieldbus scale.

The fieldbus scale depends on the number of decimals in the value specified in "Detailed parameter description" or "Default value". If there are  $n$  decimals in the value, the fieldbus scale  $m$  is the  $n^{\text{th}}$ -power of 10. Take the following table as an example,  $m$  is 10.

| Function code | Name                        | Description                          | Setting range | Default | Modify |
|---------------|-----------------------------|--------------------------------------|---------------|---------|--------|
| <u>P01.20</u> | Wake-up-from-sleep delay    | 0.0–3600.0s (valid when P01.19 is 2) | 0.00–3600.0   | 0.0s    | ○      |
| <u>P01.21</u> | Restart after power failure | 0: Disable<br>1: Enable              | 0–1           | 0       | ○      |

The value specified in "Setting range" or "Default" contains one decimal, so the fieldbus scale is 10. If the value received by the upper computer is 50, the value of "Wake-up-from-sleep delay" of the VFD is 5.0 (5.0=50/10).

To set the "Wake-up-from-sleep delay" to 5.0s through Modbus communication, you need first to multiply 5.0 by 10 according to the scale to obtain an integer 50, that is, 32H in the hexadecimal form,

and then transmit the following write command:

|                |                  |                      |                   |              |
|----------------|------------------|----------------------|-------------------|--------------|
| <u>01</u>      | <u>06</u>        | <u>01 14</u>         | <u>00 32</u>      | <u>49 E7</u> |
| VFD<br>address | Write<br>command | Parameter<br>address | Parameter<br>data | CRC          |

After receiving the command, the VFD converts 50 into 5.0 based on the fieldbus scale, and then sets "Wake-up-from-sleep delay" to 5.0s.

For another example, after the upper computer transmits the "Wake-up-from-sleep delay" parameter read command, the master receives the following response from the VFD:

|                |                  |                |                   |              |
|----------------|------------------|----------------|-------------------|--------------|
| <u>01</u>      | <u>03</u>        | <u>02</u>      | <u>00 32</u>      | <u>39 91</u> |
| VFD<br>address | Write<br>command | 2-byte<br>data | Parameter<br>data | CRC          |

The parameter data is 0032H, that is, 50, so 5.0 is obtained based on the fieldbus scale (50/10=5.0). In this case, the master identifies that the "Wake-up-from-sleep delay" is 5.0s.

9.4.7 Error message response

Operation errors may occur in communication-based control. For example, some parameters can only be read, but a write command is transmitted. In this case, the VFD returns an error message response.

Error message responses are sent from the VFD to the master. The following table describes the codes and definitions of the error message responses.

| Code | Name                 | Description                                                                                                                                                                                                                                                                                                                              |
|------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01H  | Invalid command      | The command code received by the upper computer is not allowed to be executed. The possible causes are as follows: <ul style="list-style-type: none"><li>• The function code is applicable only on new devices and is not implemented on this device.</li><li>• The slave is in the faulty state when processing this request.</li></ul> |
| 02H  | Invalid data address | For the VFD, the data address in the request of the upper computer is not allowed. In particular, the combination of the register address and the number of the to-be-transmitted bytes is invalid.                                                                                                                                      |
| 03H  | Invalid data value   | The received data domain contains a value that is not allowed. The value indicates the error of the remaining structure in the combined request.<br><b>Note:</b> It does not mean that the data item submitted for storage in the                                                                                                        |

| Code | Name                                    | Description                                                                                                                                                                                            |
|------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      |                                         | register includes a value unexpected by the program.                                                                                                                                                   |
| 04H  | Operation failure                       | The parameter is set to an invalid value in the write operation. For example, a function input terminal cannot be set repeatedly.                                                                      |
| 05H  | Password error                          | The password entered in the password verification address is different from that set in <u>P07.00</u> .                                                                                                |
| 06H  | Data frame error                        | The length of the data frame transmitted by the upper computer is incorrect, or in the RTU format, the value of the CRC check bit is inconsistent with the CRC value calculated by the lower computer. |
| 07H  | Parameter read-only                     | The parameter to be modified in the write operation of the upper computer is a read-only parameter.                                                                                                    |
| 08H  | Parameter cannot be modified in running | The parameter to be modified in the write operation of the upper computer cannot be modified during the running of the VFD.                                                                            |
| 09H  | Password protection                     | A user password is set, and the upper computer does not provide the password to unlock the system when performing a read or write operation. The error of "system locked" is reported.                 |

When returning a response, the slave device uses a function code domain and fault address to indicate whether it is a normal response (no error) or exception response (some errors occur). In a normal response, the device returns the corresponding function code and data address or sub-function code. In an exception response, the device returns a code that is equal to a normal code, but the first bit is logic 1.

For example, if the master device transmits a request message to a slave device for reading a group of function code address data, the code is generated as follows:

0 0 0 0 0 1 1 (03H in the hexadecimal form)

For an exception response, the following code is returned:

1 0 0 0 0 1 1 (83H in the hexadecimal form)

In addition to the modification of the code, the slave device returns a byte of exception code that describes the cause of the exception. After receiving the exception response, the typical processing of the master device is to transmit the request message again or modify the command based on the fault information.

For example, to set the "Channel of running commands" (P00.01, the parameter address is 0001H) of the VFD whose address is 01H to 03, the command is as follows:

|                  |                  |                      |                     |                     |
|------------------|------------------|----------------------|---------------------|---------------------|
| <u><b>01</b></u> | <u><b>06</b></u> | <u><b>00 01</b></u>  | <u><b>00 03</b></u> | <u><b>98 0B</b></u> |
| VFD<br>address   | Read<br>command  | Parameter<br>address | Parameter<br>data   | CRC                 |

However, the setting range of the "Running command channel" is 0 to 2. The value 3 exceeds the setting range. In this case, the VFD returns an error message response as shown in the following:

|                  |                            |                  |                     |
|------------------|----------------------------|------------------|---------------------|
| <u><b>01</b></u> | <u><b>86</b></u>           | <u><b>04</b></u> | <u><b>43 A3</b></u> |
| VFD<br>address   | Exception<br>response code | Error code       | CRC                 |

The exception response code 86H (generated based on the highest-order bit "1" of the write command 06H) indicates that it is an exception response to the write command (06H). The error code is 04H. From the preceding table, we can see that it indicates the error "Operation failure", which means "The parameter is set to an invalid value in the write operation".

9.4.8 Read/Write operation example

For details about the formats of the read and write commands, see sections 9.4.1 and 9.4.2.

9.4.8.1 Examples of read command 03H

Example 1: Read status word 1 of the VFD whose address is 01H. According to the table of other function addresses, the parameter address of status word 1 of the VFD is 2100H.

The read command transmitted to the VFD is as follows:

|                  |                  |                      |                     |                     |
|------------------|------------------|----------------------|---------------------|---------------------|
| <u><b>01</b></u> | <u><b>03</b></u> | <u><b>21 00</b></u>  | <u><b>00 01</b></u> | <u><b>8E 36</b></u> |
| VFD<br>address   | Read<br>command  | Parameter<br>address | Data quantity       | CRC                 |

Assume that the following response is returned:

|                  |                  |                    |                     |                     |
|------------------|------------------|--------------------|---------------------|---------------------|
| <u><b>01</b></u> | <u><b>03</b></u> | <u><b>02</b></u>   | <u><b>00 03</b></u> | <u><b>F8 45</b></u> |
| VFD<br>address   | Read<br>command  | Number<br>of bytes | Data content        | CRC                 |

The data content returned by the VFD is 0003H, which indicates that the VFD is in the stopped state.

Example 2: View information about the VFD whose address is 03H, including "Present fault type" (P07.27) to "5th-last fault type" (P07.32) of which the parameter addresses are 071BH to 0720H (contiguous 6 parameter addresses starting from 071BH).

The command transmitted to the VFD is as follows:

|                  |                  |                     |                       |                     |
|------------------|------------------|---------------------|-----------------------|---------------------|
| <u><b>03</b></u> | <u><b>03</b></u> | <u><b>07 1B</b></u> | <u><b>00 06</b></u>   | <u><b>B5 59</b></u> |
| VFD<br>address   | Read<br>command  | Start<br>address    | 6 parameters in total | CRC                 |

Assume that the following response is returned:

**03**

**03**

**0C**

**00**

**23**

**00**

**23**

**00**

**23**

**00**

**23**

**00**

**23**

**5F**

**D2**

VFD  
address

Read  
command

Number of  
bytes

Present  
fault type

Last fault  
type

2nd-last fault  
type

3rd-last fault  
type

4th-last fault  
type

5th-last fault  
type

CRC

According to the returned data, all the fault types are 0023H, that is, 35 in the decimal form, which means the maladjustment fault (STo)

9.4.8.2 Examples of write command 06H

Example 1: Set the VFD whose address is 03H to be forward running. Refer to the table of other function parameters, the address of "Communication-based control command" is 2000H, and 0001H indicates forward running.

| Function                            | Address | Data description                      | R/W |
|-------------------------------------|---------|---------------------------------------|-----|
| Communication-based control command | 2000H   | 0001H: Forward running                | R/W |
|                                     |         | 0002H: Reverse running                |     |
|                                     |         | 0003H: Forward jogging                |     |
|                                     |         | 0004H: Reverse jogging                |     |
|                                     |         | 0005H: Stop                           |     |
|                                     |         | 0006H: Coast to stop (emergency stop) |     |
|                                     |         | 0007H: Fault reset                    |     |
|                                     |         | 0008H: Jogging to stop                |     |

The command transmitted by the master is as follows:

**03**

VFD  
address

**06**

Write  
command

**20 00**

Parameter  
address

**00 01**

Forward  
running

**42 28**

CRC

If the operation is successful, the following response is returned (same as the command transmitted by the master):

**03**

VFD  
address

**06**

Write  
command

**20 00**

Parameter  
address

**00 01**

Forward  
running

**42 28**

CRC

Example 2: Set the "Max. output frequency" of the VFD whose address is 03H to 100 Hz.

| Function code | Name                  | Description               | Setting range | Default | Modify |
|---------------|-----------------------|---------------------------|---------------|---------|--------|
| P00.03        | Max. output frequency | P00.04–600.00H (400.00Hz) | 100.00–600.00 | 50.00Hz | ☉      |

According to the number of decimals, the fieldbus scale of the "Max. output frequency" (P00.03) is 100. Multiply 100 Hz by 100. The value 10000 is obtained, and it is 2710H in the hexadecimal form.

The command transmitted by the master is as follows:

|                  |                  |                      |                     |                     |
|------------------|------------------|----------------------|---------------------|---------------------|
| <b><u>03</u></b> | <b><u>06</u></b> | <b><u>00 03</u></b>  | <b><u>27 10</u></b> | <b><u>62 14</u></b> |
| VFD<br>address   | Write<br>command | Parameter<br>address | Parameter<br>data   | CRC                 |

If the operation is successful, the following response is returned (same as the command transmitted by the master):

|                  |                  |                      |                     |                     |
|------------------|------------------|----------------------|---------------------|---------------------|
| <b><u>03</u></b> | <b><u>06</u></b> | <b><u>00 03</u></b>  | <b><u>27 10</u></b> | <b><u>62 14</u></b> |
| VFD<br>address   | Write<br>command | Parameter<br>address | Parameter<br>data   | CRC                 |

**Note:** In the preceding command description, spaces are added to a command just for explanatory purposes. In practical applications, no space is required in the commands.

#### 9.4.8.3 Examples of continuously write command 10H

Example 1: Set the VFD whose address is 01H to be forward running at the frequency of 10 Hz. Refer to the table of other function parameters, the address of "Communication-based control command" is 2000H, 0001H indicates forward running, and the address of "Communication-based value setting" is 2001H, as shown in the following figure. 10 Hz is 03E8H in the hexadecimal form.

| Function                            | Address | Data description                      | R/W |
|-------------------------------------|---------|---------------------------------------|-----|
| Communication-based control command | 2000H   | 0001H: Forward running                | R/W |
|                                     |         | 0002H: Reverse running                |     |
|                                     |         | 0003H: Forward jogging                |     |
|                                     |         | 0004H: Reverse jogging                |     |
|                                     |         | 0005H: Stop                           |     |
|                                     |         | 0006H: Coast to stop (emergency stop) |     |

| Function                          | Address | Data description                                              | R/W |
|-----------------------------------|---------|---------------------------------------------------------------|-----|
| Communication-based value setting |         | 0007H: Fault reset                                            |     |
|                                   |         | 0008H: Jogging to stop                                        |     |
|                                   | 2001H   | Communication-based frequency setting (0–Fmax, unit: 0.01 Hz) | R/W |
|                                   | 2002H   | PID setting, range (0–1000, 1000 corresponding to 100.0%)     |     |

In the actual operation, set P00.01 to 2 and P00.06 to 8.

The command transmitted by the master is as follows:

01    10    20 00    00 02    04    00 01    03 E8    3B 10  
VFD    Continuous    Parameter    Parameter    Number of    Forward    10 Hz    CRC  
address    write    address    quantity    bytes    running

If the operation is successful, the following response is returned:

01    10    20 00    00 02    4A 08  
VFD    Continuous    Parameter    Parameter    CRC  
address    write    address    quantity

Example 2: Set "ACC time" of the VFD whose address is 01H to 10s, and "DEC time" to 20s.

|               |            |                                                                |                |                       |
|---------------|------------|----------------------------------------------------------------|----------------|-----------------------|
| <u>P00.11</u> | ACC time 1 | Setting range of <u>P00.11</u> and <u>P00.12</u> : 0.0–3600.0s | Model depended | <input type="radio"/> |
| <u>P00.12</u> | DEC time 1 |                                                                | Model depended | <input type="radio"/> |

The address of P00.11 is 000B, 10s is 0064H in the hexadecimal form, and 20s is 00C8H in the hexadecimal form.

The command transmitted by the master is as follows:

01    10    00 0B    00 02    04    00 64    00 C8    F2 55  
VFD    Continuous    Parameter    Parameter    Number of    10s    20s    CRC  
address    write    address    quantity    bytes

If the operation is successful, the following response is returned:

|                  |                                |                      |                       |                     |
|------------------|--------------------------------|----------------------|-----------------------|---------------------|
| <b><u>01</u></b> | <b><u>10</u></b>               | <b><u>00 0B</u></b>  | <b><u>00 02</u></b>   | <b><u>30 0A</u></b> |
| VFD<br>address   | Continuous<br>write<br>command | Parameter<br>address | Parameter<br>quantity | CRC                 |

**Note:** In the preceding command description, spaces are added to a command just for explanatory purposes. In practical applications, no space is required in the commands.

#### 9.4.8.4 Modbus communication commissioning example

A PC is used as the host, an RS232-RS485 converter is used for signal conversion, and the PC serial port used by the converter is COM1 (an RS232 port). The upper computer commissioning software is the serial port commissioning assistant Commix, which can be downloaded from the Internet. Download a version that can automatically execute the CRC check function. The following figure shows the interface of Commix.

First, set the serial port to **COM1**. Then, set the baud rate consistently with [P14.01](#). The data bits, check bits, and end bits must be set consistently with [P14.02](#). If the RTU mode is selected, you need to select the hexadecimal form **Input HEX**. To set the software to automatically execute the CRC function, you need to select **ModbusRTU**, select **CRC16 (MODBU SRTU)**, and set the start byte to **1**. After the auto CRC check function is enabled, do not enter CRC information in commands. Otherwise, command errors may occur due to repeated CRC check.

The commissioning command to set the VFD whose address is 03H to be forward running is as follows:

|                  |                  |                      |                     |                     |
|------------------|------------------|----------------------|---------------------|---------------------|
| <b><u>03</u></b> | <b><u>06</u></b> | <b><u>20 00</u></b>  | <b><u>00 01</u></b> | <b><u>42 28</u></b> |
| VFD<br>address   | Write<br>command | Parameter<br>address | Forward running     | CRC                 |

**Note:**

Set the address (P14.00) of the VFD to 03.

Set "Channel of running commands" (P00.01) to "Communication", and set "Communication channel of running commands" (P00.02) to the Modbus communication channel.

Click **Send**. If the line configuration and settings are correct, a response transmitted by the VFD is received as follows:

|                  |                  |                      |                     |                     |
|------------------|------------------|----------------------|---------------------|---------------------|
| <u><b>03</b></u> | <u><b>06</b></u> | <u><b>20 00</b></u>  | <u><b>00 01</b></u> | <u><b>42 28</b></u> |
| VFD<br>address   | Write<br>command | Parameter<br>address | Forward running     | CRC                 |

**9.5 Common communication faults**

Common communication faults include the following:

- No response is returned.
- The VFD returns an exception response.

Possible causes of no response include the following:

- The serial port is set incorrectly. For example, the converter uses the serial port COM1, but COM2 is selected for the communication.
- The settings of the baud rates, data bits, end bits, and check bits are inconsistent with those set on the VFD.
- The positive pole (+) and negative pole (-) of the RS485 bus are connected reversely.
- The resistor connected to RS485 terminals on the terminal block of the VFD is set incorrectly.

## A.2 Dimensions and installation

All expansion cards are of the same dimensions (108 mm × 39 mm) and can be installed in the same way.

Following the operation principles when installing or removing an expansion card:

- Ensure that no power is applied before installing the expansion card.
- The expansion card can be installed in any one of the SLOT1, SLOT2, and SLOT3 card slots.
- The VFD models of 5R5G/7R5P and lower can be configured with two expansion cards at the same time, and those of 7R5G/011P and higher can be configured with three expansion cards.
- If interference occurs on the external wires after expansion cards are installed, change their installation card slots flexibly to facilitate the wiring. For example, the connector of the DP card is large, so it is recommended to be installed in the SLOT1 card slot.
- To ensure high anti-interference capability in closed-loop control, you need to use a shielding wire in the encoder cable and ground the two ends of the shielding wire, that is, connect the shielding layer to the housing of the motor on the motor side, and connect the shielding layer to the PE terminal on the PG card side.

The following figure shows the installation diagram and the VFD with expansion cards installed.

Figure A.1 7R5G/011P or higher models with expansion cards installed

Figure A.2 5R5G/7R5P and lower models with expansion cards installed

Expansion card installation process:

2. Wire an expansion card as follows:

Figure A.5 Expansion card wiring

A.4 IO expansion card——EC-IO501-00

The terminals are arranged as follows:

CME and COM are shorted through J3 before delivery, and J5 is the jumper for selecting the output type (voltage or current) of AO2.

|     |     |     |
|-----|-----|-----|
| AI3 | AO2 | GND |

Indicator definition:

| Indicator | Name            | Function                                                                                                                                                                                                                                                                                                                                |
|-----------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | State indicator | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |
| LED4      | Power indicator | This indicator is on after the IO expansion card is powered on by the control board.                                                                                                                                                                                                                                                    |

The EC-IO501-00 expansion card can be used in scenarios where the I/O interfaces of the VFD cannot meet the application requirements. It can provide 4 digital inputs, 1 digital output, 1 analog input, 1 analog output, and two relay outputs. It is user-friendly, providing relay outputs through European-type screw terminals and other inputs and outputs through spring terminals.

EC-IO501-00 terminal function description:

| Category            | Sign    | Name                  | Function                                                                                                                                                                                                                                                                       |
|---------------------|---------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power               | PW      | External power supply | The working power of digital input is provided by an external power supply. Voltage range: 12–24 V<br>The terminals PW and +24V are shorted before delivery.                                                                                                                   |
| Analog input/output | AI3—GND | Analog input 1        | 1. Input range: 0–10 V, 0–20 mA<br>2. Input impedance: 20 kΩ for voltage input; 250 Ω for current input<br>3. Set it to be voltage or current input through the corresponding function code.<br>4. Resolution: When 10 V corresponds to 50 Hz, the minimum resolution is 5 mV. |

A.5 Programmable expansion card——EC-PC502-00

The terminals are arranged as follows:

SW1 is the start/stop switch of the programmable expansion card. CN1 contains terminals PE, 485-, 485+, GND, AI1, and AO1, and a selection jumper resides on the next. "AI" and "AV" are the current

type input selection and voltage type input selection of AI1, and they can be selected through J2. "AIO" and "AVO" are the current type output selection and voltage type output selection of AO1, and they can be selected through J5. "120" indicates 120Ω terminal resistor, and it can connect to J1. By default, J1 connects to NC, J2 to AV, and J5 to AVO.

| Indicator | Name                            | Function                                                                                                                                                                                                                                                                                                                                |
|-----------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | Power indicator (Green)         | This indicator is on when the expansion card is powered on.                                                                                                                                                                                                                                                                             |
| LED3      | Communication indicator (Green) | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |
| LED4      | Error indicator (Red)           | This indicator blinks when an error occurs (the blinking period is 1s, on for 0.5s, and off for the other 0.5s). You can query the error types on the upper computer Auto Station.<br><br>This indicator is off when there is no error.                                                                                                 |
| LED5      | Power indicator                 | This indicator is on when the expansion card is powered on.                                                                                                                                                                                                                                                                             |
| LED6      | RUN indicator (Green)           | This indicator is on when the PLC program is running; it is off when the PLC program stops.                                                                                                                                                                                                                                             |

The EC-PC502-00 programmable expansion card can replace some micro PLC applications. It adopts the global mainstream development environment PLC, supporting the instruction language (IL), ladder diagram (LD), and sequential function chart (SFC). It provides a user program storage space of 16K steps and data storage space of 8K words, and supports saving data of 1K words at power failure, which facilitate customers' secondary development and meets the customization requirements.

The EC-PC502-00 programmable expansion card provides 6 digital inputs, 2 relay outputs, 1 analog input, 1 analog output, and 1 RS485 communication channel (for master/slave switchover). It is user-friendly, providing relay outputs through European-type screw terminals and other inputs and outputs through spring terminals.

EC-PC502-00 terminal function description:

| Category             | Sign    | Name             | Function                                                                                                                                                                                                                                                                                                                  |
|----------------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power                | PW      | External power   | The working power of digital input is provided by an external power supply.<br>Voltage range: 12–24 V<br>The terminals PW and +24V are shorted before delivery.                                                                                                                                                           |
|                      | 24V     | Internal power   | Internal output power: 100mA                                                                                                                                                                                                                                                                                              |
| Digital input/output | PS1—COM | Digital input 1  | 1. Internal impedance: 4 kΩ<br>2. Allowable voltage input: 12–30 V<br>3. Bidirectional terminal<br>4. Max. input frequency: 1 kHz<br>5. Supporting both source type input and sink type input, but the input type must be the same                                                                                        |
|                      | PS2—COM | Digital input 2  |                                                                                                                                                                                                                                                                                                                           |
|                      | PS3—COM | Digital input 3  |                                                                                                                                                                                                                                                                                                                           |
|                      | PS4—COM | Digital input 4  |                                                                                                                                                                                                                                                                                                                           |
|                      | PS5—COM | Digital input 5  |                                                                                                                                                                                                                                                                                                                           |
|                      | PS6—COM | Digital input 6  | 1. Switch capacity: 200 mA/30 V<br>2. Output frequency range: 0–1 kHz<br>3. The terminals CME and COM are shorted through J1 before delivery.                                                                                                                                                                             |
|                      | PY1—CME | Digital output 1 |                                                                                                                                                                                                                                                                                                                           |
|                      | PY2—CME | Digital output 2 |                                                                                                                                                                                                                                                                                                                           |
| Analog input/output  | AI1     | Analog input 1   | 1. Input range: 0–10V or 0–20mA<br>2. Input resistance: 20kΩ for voltage input, and 250kΩ for current input<br>3. Whether the input is the voltage or current type is set through the jumper.<br>4. Resolution: When 10V corresponds to 50Hz, the min. resolution is 5mV.<br>5. Deviation ±1%, 25°C, full measuring range |
|                      | AO1     | Analog output 1  | 1. Output range: 0–10V voltage or 0–20mA current<br>2. Whether the output is the voltage or                                                                                                                                                                                                                               |

| Category     | Sign  | Name                      | Function                                                                                               |
|--------------|-------|---------------------------|--------------------------------------------------------------------------------------------------------|
|              |       |                           | current type is set through the jumper.<br>3. Deviation $\pm 1\%$ , 25°C, full measuring range         |
| Relay output | PRO1A | NO contact of relay 1     | 1. Contact capacity: 3A/AC 250 V, 1 A/DC 30 V<br>2. Do not use them as high-frequency digital outputs. |
|              | PRO1B | NC contact of relay 1     |                                                                                                        |
|              | PRO1C | Common contact of relay 1 |                                                                                                        |
|              | PRO2A | NO contact of relay 2     |                                                                                                        |
|              | PRO2C | Common contact of relay 2 |                                                                                                        |

For details about the operation of programmable expansion cards, see the *Goodrive350 Series VFD Auto Station Programmable Expansion Card Operation Manual*.

A.6 Communication card function description

A.6.1 Bluetooth communication card—EC-TX501 and WIFI communication card—EC-TX502

Definitions of indicators and function buttons:

| LED2             | Bluetooth communication state indicator | This indicator is on when Bluetooth communication is online and data exchange can be performed.<br><br>It is off when Bluetooth communication is not in the online state. |
| LED5             | Power indicator                         | This indicator is on after the control board feeds power to the Bluetooth card.                                                                                           |
| SW1              | WIFI factory reset button               | It is restored to default values and returned to the local monitoring mode.                                                                                               |
| SW2              | WIFI hardware reset button              | It is used to reboot the expansion card.                                                                                                                                  |

The wireless communication card is especially useful for scenarios where you cannot directly use the keypad to operate the VFD due to the restriction of the installation space. With a mobile phone APP, you can operate the VFD in a maximum distance of 30 m. You can choose a PCB antenna or an external sucker antenna. If the VFD is located in an open space and is a molded case machine, you can use a built-in PCB antenna; and if it is a sheetmetal machine and located in a metal cabinet, you need to use an external sucker antenna.

When installing a sucker antenna, install a wireless communication card on the VFD first, and then lead the SMA connector of the sucker antenna into the VFD and screw it to CN2, as shown in the following figure. Place the antenna base on the chassis and expose the upper part. Try to keep it unblocked.

The wireless communication card must be used with the INVT VFD APP. Scan the QR code of the VFD nameplate to download it. For details, refer to the wireless communication card manual provided with the expansion card. The main interface is shown as follows.

A.6.2 PROFIBUS-DP communication card——EC-TX503

CN1 is a 9-pin D-type connector, as shown in the following figure.

| Connector pin |         | Description                     |
|---------------|---------|---------------------------------|
| 1             | -       | Unused                          |
| 2             | -       | Unused                          |
| 3             | B-Line  | Data+ (twisted pair 1)          |
| 4             | RTS     | Request sending                 |
| 5             | GND_BUS | Isolation ground                |
| 6             | +5V BUS | Isolated power supply of 5 V DC |
| 7             | -       | Unused                          |
| 8             | A-Line  | Data- (twisted pair 2)          |
| 9             | -       | Unused                          |
| Housing       | SHLD    | PROFIBUS cable shielding line   |

+5V and GND\_BUS are bus terminators. Some devices, such as the optical transceiver (RS485), may need to obtain power through these pins.

On some devices, the transmission and receiving directions are determined by RTS. In normal applications, only A-Line, B-Line, and the shield layer need to be used.

Indicator definition

| Indicator | Name                    | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | State indicator         | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LED2      | Online indicator        | This indicator is on when the communication card is online and data exchange can be performed. It is off when the communication card is not in the online state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LED3      | Offline/Fault indicator | <p>This indicator is on when the communication card is offline and data exchange cannot be performed.</p> <p>It blinks when the communication card is not in the offline state.</p> <p>It blinks at the frequency of 1 Hz when a configuration error occurs: The length of the user parameter data set during the initialization of the communication card is different from that during the network configuration.</p> <p>It blinks at the frequency of 2 Hz when user parameter data is incorrect: The length or content of the user parameter data set during the initialization of the communication card is different from that during the network configuration.</p> <p>It blinks at the frequency of 4 Hz when an error occurs in the ASIC initialization of PROFIBUS communication.</p> <p>It is off when the diagnosis function is disabled.</p> |
| LED4      | Power indicator         | This indicator is on after the control board feeds power to the communication card.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

For details about the operation, see the *Goodrive350 Series VFD Communication Expansion Card Operation Manual*.

A.6.3 Ethernet communication card——EC-TX504

The EC-TX504 communication card adopts standard RJ45 terminals.

Indicator definition:

| Indicator | Name                   | Function                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | State indicator        | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |
| LED2      | LINK indicator (Green) | It is on when the connection to the upper computer is normal; it is off when the upper computer is disconnected.                                                                                                                                                                                                                        |
| LED3      | ACK indicator (Red)    | It is on when there is data to return to the upper computer; it is off when there is no data to return to the upper computer.                                                                                                                                                                                                           |
| LED4      | Power indicator        | This indicator is on after the control board feeds power to the communication card.                                                                                                                                                                                                                                                     |

A.6.4 CANopen communication card——EC-TX505 and CAN master/slave control communication card EC-TX511

The EC-TX505/511 communication card is user-friendly, adopting spring terminals.

| 3-pin spring terminal                                                             | Pin | Function | Description                   |
|-----------------------------------------------------------------------------------|-----|----------|-------------------------------|
|  | 1   | CANH     | CANopen bus high level signal |
|                                                                                   | 2   | CANG     | CANopen bus shielding         |
|                                                                                   | 3   | CANL     | CANopen bus low level signal  |

Terminal resistor switch function description:

| Terminal resistor switch                                                          | Position | Function | Description                                                    |
|-----------------------------------------------------------------------------------|----------|----------|----------------------------------------------------------------|
|  | Left     | OFF      | CAN_H and CAN_L are not connected to a terminal resistor.      |
|                                                                                   | Right    | ON       | CAN_H and CAN_L are connected to a terminal resistor of 120 Ω. |

Indicator definition:

| Indicator | Name              | Function                                                                                                                                                                                                                                                                                                                                                      |
|-----------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | State indicator   | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board.                       |
| LED4      | Power indicator   | This indicator is on after the control board feeds power to the communication card.                                                                                                                                                                                                                                                                           |
| LED5      | Running indicator | This indicator is on when the communication card is in the working state.<br>It is off when a fault occurs. Check whether the reset pin of the communication card and the power supply are properly connected.<br>It blinks when the communication card is in the pre-operation state.<br>It blinks once when the communication card is in the stopped state. |
| LED6      | Error indicator   | This indicator is on when the CAN controller bus is off                                                                                                                                                                                                                                                                                                       |

| Indicator | Name | Function                                                                                                                                                                                                                                         |
|-----------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |      | or a fault occurs on the VFD.<br>It is off when the communication card is in the working state.<br>It blinks when the address setting is incorrect.<br>It blinks once when a received frame is missed or an error occurs during frame receiving. |

For details about the operation, see the *Goodrive350 Series VFD Communication Expansion Card Operation Manual*.

A.6.5 PROFINET communication card——EC-TX509

The terminal CN2 adopts a standard RJ45 interface, where CN2 is the dual RJ45 interface, and these two RJ45 interfaces are not distinguished from each other and can be interchangeably inserted. They are arranged as follows:

| Pin | Name | Description    |
|-----|------|----------------|
| 1   | TX+  | Transmit Data+ |
| 2   | TX-  | Transmit Data- |
| 3   | RX+  | Receive Data+  |
| 4   | n/c  | Not connected  |
| 5   | n/c  | Not connected  |
| 6   | RX-  | Receive Data-  |
| 7   | n/c  | Not connected  |
| 8   | n/c  | Not connected  |

Indicator definition:

The PROFINET communication card has 9 indicators, of which LED1 is the power indicator, LED2–5 are the communication state indicators of the communication card, and LED6–9 are the state indicators of the network port.

| LED                           | Color | State    | Description                                                                                             |
|-------------------------------|-------|----------|---------------------------------------------------------------------------------------------------------|
| LED1                          | Green |          | 3.3V power indicator                                                                                    |
| LED2<br>(Bus state indicator) | Red   | On       | No network connection                                                                                   |
|                               |       | Blinking | The connection to the network cable between the Profinet controller is OK, but the communication is not |

| LED6/7<br>(Network port state indicator)         | Green | On       | PROFINET communication card and PC/PLC have been connected via a network cable |
|                                                  |       | Off      | PROFINET communication card and PC/PLC have not been connected yet             |
| LED8/9<br>(Network port communication indicator) | Green | On       | PROFINET communication card and PC/PLC are communicating                       |
|                                                  |       | Off      | PROFINET communication card and PC/PLC are not yet communicating               |

Electrical connection:

The Profinet communication card adopts a standard RJ45 interface, which can be used in a linear network topology and a star network topology. The linear network topology electrical connection diagram is shown below.

Linear network topology electrical connection diagram

**Note:** For the star network topology, you need to prepare Profinet switches.

The star network topology electrical connection diagram is shown below:

A.7 PG expansion card function description

A.7.1 Sin/Cos PG card——EC-PG502

The terminals are arranged as follows:

|     |     |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| PE  | AO+ | BO+ | ZO+ | A1+ | B1+ | R1+ | A2+ | B2+ | Z2+ | PWR |
| GND | AO- | BO- | ZO- | A1- | B1- | R1- | A2- | B2- | Z2- | GND |
|     |     |     |     |     |     |     | C1+ | C1- | D1+ | D1- |

Indicator definition:

| Indicator | Name                    | Function                                                                                                                                                                                                                                                                                                                                |
|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | Disconnection indicator | This indicator is off when A1 and B1 of the encoder are disconnected; it blinks when C1 and D1 of the encoder are disconnected; and it is on the encoder signals are normal.                                                                                                                                                            |
| LED2      | Power indicator         | This indicator is on after the control board feeds power to the PG card.                                                                                                                                                                                                                                                                |
| LED3      | State indicator         | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |

The following figure shows the external wiring of the PG card when it is used in combination with an encoder without CD signals.

The following figure shows the external wiring of the PG card when it is used in combination with an encoder with CD signals.

A.7.2 UVW incremental PG card——EC-PG503-05

The terminals are arranged as follows:

|     |     |     |     |     | A2+ | A2- | B2+ | B2- | Z2+ | Z2-  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|------|
| PE  | AO+ | BO+ | ZO+ | A1+ | B1+ | Z1+ | U+  | V+  | W+  | PWR  |
| GND | AO- | BO- | ZO- | A1- | B1- | Z1- | U-  | V-  | W-  | PGND |

Indicator definition:

| Indicator | Name                    | Function                                                                                                                                                                                                                                                                                                                                |
|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | State indicator         | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |
| LED2      | Disconnection indicator | This indicator is off when A1 and B1 of the encoder is disconnected; and it is on when the pulses are normal.                                                                                                                                                                                                                           |
| LED3      | Power indicator         | This indicator is on after the control board feeds power to the PG card.                                                                                                                                                                                                                                                                |

The EC-PG503-05 expansion card supports the input of absolute position signals and integrates the advantages of absolute and incremental encoders. It is user-friendly, adopting spring terminals.

EC-PG503-05 terminals are described as follows:

| Signal | Port          | Function             |
|--------|---------------|----------------------|
| PWR    | Encoder power | Voltage: 5 V±5%      |
| PGND   |               | Max. current: 200 mA |

| Signal | Port                     | Function                                                                                                                                              |
|--------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| A1+    | Encoder interface        | 1. Differential incremental PG interface of 5 V<br>2. Response frequency: 400 kHz                                                                     |
| A1-    |                          |                                                                                                                                                       |
| B1+    |                          |                                                                                                                                                       |
| B1-    |                          |                                                                                                                                                       |
| Z1+    |                          |                                                                                                                                                       |
| Z1-    |                          |                                                                                                                                                       |
| A2+    | Pulse setting            | 1. Differential input of 5 V<br>2. Response frequency: 200 kHz                                                                                        |
| A2-    |                          |                                                                                                                                                       |
| B2+    |                          |                                                                                                                                                       |
| B2-    |                          |                                                                                                                                                       |
| Z2+    |                          |                                                                                                                                                       |
| Z2-    |                          |                                                                                                                                                       |
| AO+    | Frequency-divided output | 1. Differential output of 5 V<br>2. Supporting frequency division of 1–255, which can be set through <a href="#">P20.16</a> or <a href="#">P24.16</a> |
| AO-    |                          |                                                                                                                                                       |
| BO+    |                          |                                                                                                                                                       |
| BO-    |                          |                                                                                                                                                       |
| ZO+    |                          |                                                                                                                                                       |
| ZO-    |                          |                                                                                                                                                       |
| U+     | UVW encoder interface    | 1. Absolute position (UVW information) of the hybrid encoder, differential input of 5 V<br>2. Response frequency: 40 kHz                              |
| U-     |                          |                                                                                                                                                       |
| V+     |                          |                                                                                                                                                       |
| V-     |                          |                                                                                                                                                       |
| W+     |                          |                                                                                                                                                       |
| W-     |                          |                                                                                                                                                       |

The following figure shows the external wiring of the EC-PG503-05 expansion card.

The following figure shows the external wiring of the EC-PG504-00 expansion card.

A.7.4 Multifunction incremental PG card——EC-PG505-12

The terminals are arranged as follows:

The dual in-line package (DIP) switch SW1 is used to set the voltage class (5 V or 12 V) of the power supply of the encoder. The DIP switch can be operated with an auxiliary tool.

Indicator definition:

| Indicator | Name             | Function                                                                                                                       |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| LED1      | Status indicator | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after |

| Indicator | Name                    | Function                                                                                                                                                                                                 |
|-----------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |                         | the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |
| LED2      | Disconnection indicator | This indicator is off when A1 and B1 of the encoder is disconnected; and it is on when the pulses are normal.                                                                                            |
| LED3      | Power indicator         | This indicator is on after the control board feeds power to the PG card.                                                                                                                                 |

The EC-PG505-12 expansion card can be used in combination with multiple types of incremental encoders through different modes of wiring. It is user-friendly, adopting spring terminals.

EC-PG505-12 terminal function description:

| Signal | Port                     | Function                                                                                                                                                                                |

The following figure shows the external wiring of the expansion card used in combination with an open collector encoder. A pull-up resistor is configured inside the PG card.

The following figure shows the external wiring of the expansion card used in combination with a push-pull encoder.

The following figure shows the external wiring of the expansion card used in combination with a differential encoder.

A.7.5 24V multi-function incremental PG card——EC-PG505-24

The terminals are arranged as follows:

|     |      |    |     |     |     |     |     |     |      |
|-----|------|----|-----|-----|-----|-----|-----|-----|------|
| PE  | AO   | BO | A1+ | B1+ | Z1+ | A2+ | B2+ | Z2+ | PWR  |
| GND | PGND | ZO | A1- | B1- | Z1- | A2- | B2- | Z2- | PGND |

Indicator definition:

| Indicator | Name                    | Function                                                                                                                                                                                                                                                                                                                                |
|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LED1      | State indicator         | This indicator is on when the expansion card is establishing a connection with the control board; it blinks periodically after the expansion card is properly connected to the control board (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |
| LED2      | Disconnection indicator | This indicator is off when A1 and B1 of the encoder are disconnected; it is on when the encoder pulses are normal; and it blinks when an exception occurs in the communication between the encoder and control board.                                                                                                                   |
| LED3      | Power indicator         | This indicator is on after the control board feeds power to the PG card.                                                                                                                                                                                                                                                                |

EC-PG505-24 can work in combination with multiple types of incremental encoders through various external wiring modes. It is user-friendly, adopting spring terminals.

EC-PG505-24 terminal function description

| Signal | Port                 | Function                                                                                                                  |
|--------|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| PWR    | Encoder power supply | Voltage: 24 V $\pm$ 5%                                                                                                    |
| PGND   |                      | Max. output current: 150 mA                                                                                               |

The following figure shows the external wiring of the PG card when it is used in combination with an open-drain collector encoder. A pull-up resistor is configured in the PG card.

The following figure shows the external wiring of the PG card when it is used in combination with a push-pull encoder.

A.7.6 Simplified incremental PG card——EC-PG507-12

The terminals are arranged as follows:

The DIP switch SW1 is used to set the voltage class (5 V or 12 V) of the power supply of the encoder. The DIP switch can be operated with an auxiliary tool.

|           |                         | (the period is 1s, on for 0.5s, and off for the other 0.5s); and it is off when the expansion card is disconnected from the control board. |
| LED2      | Disconnection indicator | This indicator is off when A1 and B1 of the encoder are disconnected; it is on when the encoder pulses are normal.                         |
| LED3      | Power indicator         | This indicator is on after the control board feeds power to the PG card.                                                                   |

EC-PG507-12 can work in combination with multiple types of incremental encoders through various external wiring modes, which are similar to the wiring modes of EC-PG505-12.

EC-PG507-12 terminals are described as follows:

| Signal | Port              | Function                                                                                                                                                                                                                                     |
|--------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PWR    | Encoder power     | Voltage: 5V/12V $\pm$ 5%<br>Max. current: 150 mA<br>The voltage class can be selected through SW1, depending on the encoder voltage class.<br>(PGND is the isolation power ground.)                                                          |
| PGND   |                   |                                                                                                                                                                                                                                              |
| A1+    | Encoder interface | 1. Supporting push-pull interfaces of 5 V/12 V<br>2. Supporting open collector interfaces of 5 V/12 V<br>3. Supporting differential interfaces of 5 V<br>4. Response frequency: 400 kHz<br>5. Support the encoder cable length of up to 50 m |
| A1-    |                   |                                                                                                                                                                                                                                              |
| B1+    |                   |                                                                                                                                                                                                                                              |
| B1-    |                   |                                                                                                                                                                                                                                              |
| Z1+    |                   |                                                                                                                                                                                                                                              |
| Z1-    |                   |                                                                                                                                                                                                                                              |

# Appendix B Technical data

## B.1 What this chapter contains

This chapter describes the technical data of the VFD and its compliance to CE and other quality certification systems.

## B.2 Derated application

### B.2.1 Capacity

Choose a VFD model based on the rated current and power of the motor. To ensure the rated power of the motor, the rated output current of the VFD must be greater or equal to the rated current of the motor. The rated power of the VFD must be higher or equal to that of the motor.

**Note:**

- The maximum allowable shaft power of the motor is limited to 1.5 times the rated power of the motor. If the limit is exceeded, the VFD automatically restricts the torque and current of the motor. This function effectively protect the input shaft against overload.
- The rated capacity is the capacity at the ambient temperature of 40°C.
- You need to check and ensure that the power flowing through the common DC connection in the common DC system does not exceed the rated power of the motor.

### B.2.2 Derating

If the ambient temperature on the site where the VFD is installed exceeds 40°C, the altitude exceeds 1000 m, a cover with heat dissipation vents is used, or the carrier frequency is higher than the recommended, the VFD needs to be derated.

#### B.2.2.1. Derating due to temperature

When the temperature ranges from +40°C to +50°C, the rated output current is derated by 1% for each increased 1°C. For the actual derating, see the following figure.

**Note:** It is not recommended to use the VFD at a temperature higher than 50°C. If you do, you shall be held accountable for the consequences caused.

**B.2.2.2. Derating due to altitude**

When the altitude of the site where the VFD is installed is lower than 1000 m, the VFD can run at the rated power. When the altitude exceeds 1000m, derate by 1% for every increase of 100m. When the altitude exceeds 3000m, consult the local INVT dealer or local INVT office for details.

**B.2.2.3. Derating due to carrier frequency**

The power of the VFD varies according to carrier frequencies. The VFD rated power is defined based on the carrier frequency set in factory. If the carrier frequency exceeds the factory setting, the power of the VFD is derated by 10% for each increased 1 kHz.

**B.3 Grid specifications**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Grid voltage</b>           | AC 3PH 380V(-15%)–440V(+10%)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Short-circuit capacity</b> | According to the definition of IEC 60439-1, the 1R5G/2R2P–015G/018P VFD models are suitable for the use on the grid with the maximum expected short-circuit current no more than 5kA at the maximum rated voltage; the 018G/022P–090G/011P VFD models are suitable for the use on the grid with the maximum expected short-circuit current no more than 22kA at the maximum rated voltage; the 110G/132P–500G VFD models are suitable for the use on the grid with maximum expected short-circuit current no more than 100kA at the maximum rated voltage. |
| <b>Frequency</b>              | 50/60 Hz±5%, with a maximum change rate of 20%/s                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**B.4 Motor connection data**

|                                 |                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Motor type</b>               | Asynchronous induction motor or permanent magnetic synchronous motor                                                                     |
| <b>Voltage</b>                  | 0–U <sub>1</sub> (rated voltage of the motor), 3PH symmetrical, U <sub>max</sub> (rated voltage of the VFD) at the field-weakening point |
| <b>Short-circuit protection</b> | The short-circuit protection for the motor output meets the requirements of IEC 61800-5-1.                                               |
| <b>Frequency</b>                | 0–400 Hz                                                                                                                                 |
| <b>Frequency resolution</b>     | 0.01 Hz                                                                                                                                  |
| <b>Current</b>                  | See 3.6 Product ratings.                                                                                                                 |
| <b>Power limit</b>              | 1.5 times of the rated power of the motor                                                                                                |
| <b>Field-weakening point</b>    | 10–400 Hz                                                                                                                                |
| <b>Carrier frequency</b>        | 4, 8, 12, or 15 kHz                                                                                                                      |

**B.5 Application standards**

The following table describes the standards that the VFD complies with.

|                     |                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------|
| EN/ISO 13849-1      | Safety of machinery—Safety-related parts of control systems—Part 1: General principles for design                           |
| IEC/EN 60204-1      | Safety of machinery—Electrical equipment of machines. Part 1: General requirements                                          |
| IEC/EN 62061        | Safety of machinery—Safety-related functional safety of electrical, electronic, and programmable electronic control systems |
| IEC/EN 61800-3+A1   | Adjustable speed electrical power drive systems—Part 3: EMC requirements and specific test methods                          |
| IEC/EN 61800-5-1+A1 | Adjustable speed electrical power drive systems—Part 5-1: Safety requirements—Electrical, thermal and energy                |
| IEC/EN 61800-5-2+A1 | Adjustable speed electrical power drive systems—Part 5-2: Safety requirements—Function                                      |

### B.5.1 CE marking

The CE marking on the name plate of the VFD indicates that the VFD is CE-compliant, meeting the regulations of the European low-voltage directive (2014/35/EU) and EMC directive (2014/30/EU).

### B.5.2 EMC compliance declaration

European union (EU) stipulates that the electric and electrical devices sold in Europe cannot generate electromagnetic disturbance that exceeds the limits stipulated in related standards, and can work properly in environments with certain electromagnetic interference. The EMC product standard (EN 61800-3) describes the EMC standards and specific test methods for adjustable speed electrical power drive systems. INVT products have strictly followed these EMC regulations.

## B.6 EMC regulations

The EMC product standard (EN 61800-3) describes the EMC requirements on VFDs.

Application environment categories

Category I: Civilian environments, including application scenarios where VFDs are directly connected to the civil power supply low-voltage grids without intermediate transformers

Category II: All environments except those in Category I.

VFD categories

C1: Rated voltage lower than 1000 V, applied to environments of Category I.

C2: Rated voltage lower than 1000 V, non-plug, socket, or mobile devices; power drive systems that must be installed and operated by specialized personnel when applied to environments of Category I

**Note:** The EMC standard IEC/EN 61800-3 no longer restricts the power distribution of VFDs, but it specifies their use, installation, and commissioning. Specialized personnel or organizations must have the necessary skills (including the EMC-related knowledge) for installing and/or performing commissioning on the electrical drive systems.

C3: Rated voltage lower than 1000 V, applied to environments of Category II. They cannot be applied

to environments of Category I.

C4: Rated voltage higher than 1000 V, or rated current higher or equal to 400 A, applied to complex systems in environments of Category II.

**B.6.1 VFD category of C2**

The induction disturbance limit meets the following stipulations:

- 1. Select an optional EMC filter according to "Optional peripheral accessories" and install it following the description in the EMC filter manual.
- 2. Select the motor and control cables according to the description in the manual.
- 3. Install the VFD according to the description in the manual.

|                                                                                   |                                                                                                                                      |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
|  | ✧ Currently in environments in China, the VFD may generate radio interference, you need to take measures to reduce the interference. |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|

**B.6.2 VFD category of C3**

The anti-interference performance of the VFD meets the requirements of environments Category II in the IEC/EN 61800-3 standard.

The induction disturbance limit meets the following stipulations:

- 1. Select an optional EMC filter according to "Optional peripheral accessories" and install it following the description in the EMC filter manual.
- 2. Select the motor and control cables according to the description in the manual.
- 3. Install the VFD according to the description in the manual.

|                                                                                   |                                                                                                                                                                               |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ✧ VFDs of C3 category cannot be applied to civilian low-voltage common grids. When applied to such grids, the VFDs may generate radio frequency electromagnetic interference. |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Appendix C Dimension drawings

### C.1 What this chapter contains

This chapter describes the dimension drawings of the VFD. The dimension unit used in the drawings is mm.

### C.2 Keypad structure

#### C.2.1 Structure diagram

Figure C.1 Keypad structure diagram

#### C.2.2 Keypad installation bracket

**Note:** When installing an external keypad, you can directly use threaded screws or a keypad bracket. For VFD models of 1R5G/2R2P-075G/090P, you need to use optional keypad installation brackets. For those of 090G/110P-500G, you can use optional brackets or use the standard keypad brackets externally.

## Appendix D Optional peripheral accessories

### D.1 What this chapter contains

This chapter describes how to select optional accessories of the VFD.

### D.2 Wiring of peripheral accessories

The following figure shows the external wiring of the VFD.

#### Note:

- The VFD models of 037G/045P and lower are equipped with built-in braking units, and those of 045G/055P–055G/075P can be configured with optional built-in braking units.
- The VFD models of 018G–110G/132P are equipped with built-in DC reactors.
- P1 terminals are equipped only for the VFD models of 132G/160P and higher, which enable the VFD models to be directly connected to external DC reactors.
- The braking units are INVT DBU series standard braking units. For details, see the DBU operation manual.

| Image                                                                               | Name                             | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Cable                            | Accessory for signal transmission                                                                                                                                                                                                                                                                                                                              |
|    | Breaker                          | Device for electric shock prevention and protection against short-to-ground that may cause current leakage and fire. Select residual-current circuit breakers (RCCBs) that are applicable to VFDs and can restrict high-order harmonics, and of which the rated sensitive current for one VFD is larger than 30 mA.                                            |
|    | Input reactor                    | Accessories used to improve the current adjustment coefficient on the input side of the VFD, and thus restrict high-order harmonic currents.<br><br>The VFD models of 132G/160P and higher can be directly connected to external DC reactors.                                                                                                                  |
|    | DC reactor                       |                                                                                                                                                                                                                                                                                                                                                                |
|    | Input filter                     | Accessory that restricts the electromagnetic interference generated by the VFD and transmitted to the public grid through the power cable. Try to install the input filter near the input terminal side of the VFD.                                                                                                                                            |
|    | Braking unit or braking resistor | Accessories used to consume the regenerative energy of the motor to reduce the DEC time.<br><br>The VFD models of 037G/045P and lower need only to be configured with braking resistors, those of 132G/160P and higher also need to be configured with braking units, and those of 045G/055P-055G/075P can be configured with optional built-in braking units. |
|  | Output filter                    | Accessory used to restrict interference generated in the wiring area on the output side of the VFD. Try to install the output filter near the output terminal side of the VFD.                                                                                                                                                                                 |
|  | Output reactor                   | Accessory used to lengthen the valid transmission distance of the VFD, which effectively restrict the transient high voltage generated during the switch-on and switch-off of the IGBT module of the VFD.                                                                                                                                                      |

### D.3 Power supply

See Installation guidelines.

✧ Ensure that the voltage class of the VFD is consistent with that of the grid.

## D.4 Cables

### D.4.1 Power cables

The sizes of the input power cables and motor cables must meet the local regulation.

- The input power cables and motor cables must be able to carry the corresponding load currents.
- The maximum temperature margin of the motor cables in continuous operation cannot be lower than 70°C.
- The conductivity of the PE grounding conductor is the same as that of the phase conductor, that is, the cross-sectional areas are the same.
- For details about the EMC requirements, see Appendix B Technical data

To meet the EMC requirements stipulated in the CE standards, you must use symmetrical shielded cables as motor cables (as shown in the following figure).

Four-core cables can be used as input cables, but symmetrical shielded cables are recommended. Compared with four-core cables, symmetrical shielded cables can reduce electromagnetic radiation as well as the current and loss of the motor cables.

**Note:** If the conductivity of the shield layer of the motor cables cannot meet the requirements, separate PE conductors must be used.

To protect the conductors, the cross-sectional area of the shielded cables must be the same as that of the phase conductors if the cable and conductor are made of materials of the same type. This reduces grounding resistance, and thus improves impedance continuity.

To effectively restrict the emission and conduction of radio frequency (RF) interference, the conductivity of the shielded cable must at least be 1/10 of the conductivity of the phase conductor. This requirement can be well met by a copper or aluminum shield layer. The following figure shows the minimum requirement on motor cables of a VFD. The cable must consist of a layer of spiral-shaped copper strips. The denser the shield layer is, the more effectively the electromagnetic interference is restricted.

Cross-section of the cable

#### D.4.2 Control cables

All analog control cables and cables used for frequency input must be shielded cables. Analog signal cables need to be double-shielded twisted-pair cables (as shown in figure a). Use one separate shielded twisted pair for each signal. Do not use the same ground wire for different analog signals.

Power cable arrangement

For low-voltage digital signals, double-shielded cables are recommended, but shielded or unshielded twisted pairs (as shown in figure b) also can be used. For frequency signals, however, only shielded cables can be used.

Relay cables need to be those with metal braided shield layers.

Keypads need to be connected by using network cables. In complicated electromagnetic environments, shielded network cables are recommended.

**Note:** Analog signals and digital signals cannot use the same cables, and their cables must be arranged separately.

Do not perform any voltage endurance or insulation resistance tests, such as high-voltage insulation tests or using a megameter to measure the insulation resistance, on the VFD or its components. Insulation and voltage endurance tests have been performed between the main circuit and chassis of each VFD before delivery. In addition, voltage limiting circuits that can automatically cut off the test voltage are configured inside the VFDs.

**Note:** Check the insulation conditions of the input power cable of a VFD according to the local regulations before connecting it.

**D.4.3 Recommended cable sizes**

Table D.1 AC 3PH 380V(-15%)–440V(+10%)

**Note:**

- Cables of the sizes recommended for the main circuit can be used in scenarios where the ambient temperature is lower than 40°C, the wiring distance is shorter than 100 m, and the current is the rated current.
- The terminals P1, (+), PB, and (-) are used to connect to DC reactors and brake accessories.

**D.4.4 Cable arrangement**

Motor cables must be arranged away from other cables. The motor cables of several VFDs can be arranged in parallel. It is recommended that you arrange the motor cables, input power cables, and control cables separately in different trays. The output dU/dt of the VFDs may increase electromagnetic interference on other cables. Do not arrange other cables and the motor cables in parallel.

If a control cable and power cable must cross each other, ensure that the angle between them is 90 degrees.

The cable trays must be connected properly and well grounded. Aluminum trays can implement local equipotential.

The following figure shows the cable arrangement distance requirements.

**Cable arrangement distances**

**D.4.5 Insulation inspection**

Check the motor and the insulation conditions of the motor cable before running the motor.

1. Ensure that the motor cable is connected to the motor, and then remove the motor cable from the U, V, and W output terminals of the VFD.
2. Use a megameter of 500 V DC to measure the insulation resistance between each phase conductor and the protection grounding conductor. For details about the insulation resistance of the motor, see the description provided by the manufacturer.

**Note:** The insulation resistance is reduced if it is damp inside the motor. If it may be damp, you need to dry the motor and then measure the insulation resistance again.

## D.5 Breaker and electromagnetic contactor

You need to add a fuse to prevent overload.

You need to configure a manually manipulated molded case circuit breaker (MCCB) between the AC power supply and VFD. The breaker must be locked in the open state to facilitate installation and inspection. The capacity of the breaker needs to be 1.5 to 2 times the rated current of the VFD.

◇ According to the working principle and structure of breakers, if the manufacturer's regulation is not followed, hot ionized gases may escape from the breaker enclosure when a short-circuit occurs. To ensure safe use, exercise extra caution when installing and placing the breaker. Follow the manufacturer's instructions.

To ensure safety, you can configure an electromagnetic contactor on the input side to control the switch-on and switch-off of the main circuit power, so that the input power supply of the VFD can be effectively cut off when a system fault occurs.

Table D.2 AC 3PH 380V(-15%)–440V(+10%)

**Note:** The accessory specifications described in the preceding table are ideal values. You can select accessories based on the actual market conditions, but try not to use those with lower values.

## D.6 Reactors

When the voltage of the grid is high, the transient large current that flows into the input power circuit may damage rectifier components. You need to configure an AC reactor on the input side, which can also improve the current adjustment coefficient on the input side.

When the distance between the VFD and motor is longer than 50 m, the parasitic capacitance between the long cable and ground may cause large leakage current, and overcurrent protection of the VFD may be frequently triggered. To prevent this from happening and avoid damage to the motor insulator, compensation must be made by adding an output reactor. When a VFD is used to drive multiple motors, take the total length of the motor cables (that is, sum of the lengths of the motor cables) into account. When the total length is longer than 50 m, an output reactor must be added on the output side of the VFD. If the distance between the VFD and motor is 50 m to 100 m, select the reactor according to the following table. If the distance is longer than 100 m, contact INVT's technical support technicians.

DC reactors can be directly connected to the VFD models of 132G/160P or higher and the 660 V series. DC reactors can improve the power factor, avoid damage to bridge rectifiers caused due to large input current of the VFD when large-capacity transformers are connected, and also avoid damage to the rectification circuit caused due to harmonics generated by grid voltage transients or phase-control loads.

Input reactor

DC reactor

Output reactor

| GD350A-450G/500P-4 | Standard      | DCL2-500-4 | OCL2-500-4     |
| GD350-500G-4       | Standard      | DCL2-500-4 | OCL2-500-4     |

**Note:**

- The rated input voltage drop of input reactors is  $2\% \pm 15\%$ .
- The current adjustment coefficient on the input side of the VFD is higher than 90% after a DC reactor is configured.
- The rated output voltage drop of output reactors is  $1\% \pm 15\%$ .
- The preceding table describes external accessories. You need to specify the ones you choose when purchasing accessories.

**D.7 Filters**

J10 is not connected in factory for VFD models of 110G/132P and lower. Connect the J10 packaged with the manual if the requirements of level C3 need to be met;

J10 is connected in factory for VFDs of 132G/160P and higher, all of which meet the requirements of level C3.

**Note:**

Disconnect J10 in the following situations:

- The EMC filter is applicable to the neutral-grounded grid system. If it is used for the IT grid system (that is, non-neutral grounded grid system), disconnect J10.
- If leakage protection occurs during configuration of a residual-current circuit breaker, disconnect J10.

**Note:** Do not connect C3 filters in IT power systems.

Interference filters on the input side can reduce the interference of VFDs (when used) on the surrounding devices.

Noise filters on the output side can decrease the radio noise caused by the cables between VFDs and motors and the leakage current of conducting wires.

INVT provides some of the filters for you to choose.

| GD350-500G-4       |                |                |

**Note:**

- The input EMI meets the C2 requirements after an input filter is configured.
- The preceding table describes external accessories. You need to specify the ones you choose when purchasing accessories.

## D.8 Braking system

### D.8.1 Brake component selection

When the VFD driving a high-inertia load decelerates or needs to decelerate abruptly, the motor runs in the power generation state and transmits the load-carrying energy to the DC circuit of the VFD, causing the bus voltage of the VFD to rise. If the bus voltage exceeds a specific value, the VFD reports an overvoltage fault. To prevent this from happening, you need to configure brake components.

|                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <ul style="list-style-type: none"> <li>✧ The design, installation, commissioning, and operation of the device must be performed by trained and qualified professionals.</li> <li>✧ Follow all the "Warning" instructions during the operation. Otherwise, major physical injuries or property loss may be caused.</li> <li>✧ Only qualified electricians are allowed to perform the wiring. Otherwise, damage to the VFD or brake components may be caused.</li> <li>✧ Read the braking resistor or unit instructions carefully before connecting them to the VFD.</li> <li>✧ Connect braking resistors only to the terminals PB and (+), and braking units only to the terminals (+) and (-). Do not connect them to other terminals. Otherwise, damage to the brake circuit and VFD and fire may be caused.</li> </ul> |
|  | <ul style="list-style-type: none"> <li>✧ Connect the brake components to the VFD according to the wiring diagram. If the wiring is not properly performed, damage to the VFD or other devices may be caused.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

The VFD models of 037G/045P and lower are equipped with built-in braking units, and those of 045G/055P and higher need to be configured with external braking units. The VFD models of 045G/055P–055G/075P can be configured with optional built-in braking units, and after a built-in braking unit is configured, the VFD model code is added with a suffix "-B", for example, GD350A-045G/055P-4-B. Select braking resistors according to the specific requirements (such as the brake torque and brake usage requirements) on site.

Table D.5 Braking units for AC 3PH 380V(-15%)–440V(+10%)

| VFD model          | Braking unit model            | Resistance applicable for 100% brake torque (Ω) | Dissipated power of braking resistor (kW) |                 |                 | Min. allowable brake resistance (Ω) |

**Note:**

- Select braking resistors according to the resistance and power data provided by our company.

- The braking resistor may increase the brake torque of the VFD. The preceding table describes the resistance and power for 100% brake torque, 10% brake usage, 50% brake usage, and 80% brake usage. You can select the braking system based on the actual operation conditions.
- When using an external braking unit, set the brake voltage class of the braking unit properly by referring to the manual of the dynamic braking unit. If the voltage class is set incorrectly, the VFD may not run properly.

|                                                                                   |                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ⚡ Do not use braking resistors whose resistance is lower than the specified minimum resistance. The VFD does not provide protection against overcurrent caused by resistors with low resistance.                                      |
|  | ⚠ In scenarios where brake is frequently implemented, that is, the brake usage is greater than 10%, you need to select a braking resistor with higher power as required by the operation conditions according to the preceding table. |

**D.8.2 Braking resistor cable selection**

Braking resistor cables need to be shielded cables.

**D.8.3 Braking resistor installation**

All resistors need to be installed in places with good cooling conditions.

|                                                                                   |                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ⚡ The materials near the braking resistor or braking unit must be non-flammable. The surface temperature of the resistor is high. Air flowing from the resistor is of hundreds of degrees Celsius. Prevent any materials from coming into contact with the resistor. |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Installation of braking resistors

|                                                                                    |                                                                                                                                                   |
|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ⚡ The VFD models of 037G/045P and lower need only external braking resistors.<br>⚡ PB and (+) are the terminals for connecting braking resistors. |
|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

Installation of braking units:

- ✧ (+) and (-) are the terminals for connecting braking units.
- ✧ The connection cables between the (+) and (-) terminals of the VFD and those of a braking unit must be shorter than 5 m, and the connection cables between the BR1 and BR2 terminals of a braking unit and the terminals of a braking resistor must be shorter than 10 m.

The following figure shows the connection of one VFD to a dynamic braking unit.

Appendix E STO function description

Reference standards: IEC 61508-1, IEC 61508-2, IEC 61508-3, IEC 61508-4, IEC 62061, ISO 13849-1, IEC 61800-5-2.

You can enable the safe torque off (STO) function to prevent unexpected startups when the main power supply of the drive is not switched off. The STO function switches off the drive output by turning off the drive signals to prevent unexpected startups of the motor (see the following figure). After the STO function is enabled, you can perform some-time operations (such as non-electrical cleaning in the lathe industry) and maintain the non-electrical components of the device without switching off the drive.

E.1 STO function logic

The following table describes the input states and corresponding faults of the STO function.

| STO input state                              | Corresponding fault                                                                                                                                                   |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H1 and H2 opened simultaneously              | The STO function is triggered, and the drive stops running.<br>Fault code:<br>40: Safe torque off (STO)                                                               |
| H1 and H2 closed simultaneously              | The STOP function is not triggered, and the drive runs properly.                                                                                                      |
| One of H and H2 opened, and the other closed | The STL1, STL2, or STL3 fault occurs.<br>Fault code:<br>41: Channel H1 exception (STL1)<br>42: Channel H2 exception (STL2)<br>43: Channel H1 and H2 exceptions (STL3) |

E.2 STO channel delay description

The following table describes the trigger and indication delay of the STO channels.

| STO mode        | STO trigger and indication delay <sup>1, 2</sup>   |
|-----------------|----------------------------------------------------|
| STO fault: STL1 | Trigger delay < 10 ms<br>Indication delay < 280 ms |
| STO fault: STL2 | Trigger delay < 10 ms<br>Indication delay < 280 ms |
| STO fault: STL3 | Trigger delay < 10 ms<br>Indication delay < 280 ms |
| STO fault: STO  | Trigger delay < 10 ms<br>Indication delay < 100 ms |

1. STO function trigger delay: Time interval between trigger the STO function and switching off the drive output
2. STO instruction delay: Time interval between trigger the STO function and STO output state indication

### STO function installation checklist

Before installing the STO, check the items described in the following table to ensure that the STO function can be properly used.

|                          | Item                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <input type="checkbox"/> | Ensure that the drive can be run or stopped randomly during commissioning.                                                                                                                                                                                                                                                                                                                 |
| <input type="checkbox"/> | Stop the drive (if it is running), disconnect the input power supply, and isolate the drive from the power cable through the switch.                                                                                                                                                                                                                                                       |
| <input type="checkbox"/> | Check the STO circuit connection according to the circuit diagram.                                                                                                                                                                                                                                                                                                                         |
| <input type="checkbox"/> | Check whether the shielding layer of the STO input cable is connected to the +24 V reference ground COM.                                                                                                                                                                                                                                                                                   |
| <input type="checkbox"/> | Connect the power supply.                                                                                                                                                                                                                                                                                                                                                                  |
| <input type="checkbox"/> | Test the STO function as follows after the motor stops running: <ul style="list-style-type: none"> <li>• If the drive is running, send a stop command to it and wait until the shaft of the motor stops rotating.</li> <li>• Activate the STO circuit and send a start command to the drive. Ensure that the motor does not start.</li> <li>• Deactivate the STO circuit.</li> </ul>       |
| <input type="checkbox"/> | Restart the drive, and check whether the motor is running properly.                                                                                                                                                                                                                                                                                                                        |
| <input type="checkbox"/> | Test the STO function as follows when the motor is running: <ul style="list-style-type: none"> <li>• Start the drive. Ensure that the motor is running properly.</li> <li>• Activate the STO circuit.</li> <li>• The drive reports an STO fault (for details, see 5.5.19 Fault handling). Ensure that the motor coasts to stop rotating.</li> <li>• Deactivate the STO circuit.</li> </ul> |
| <input type="checkbox"/> | Restart the drive, and check whether the motor is running properly.                                                                                                                                                                                                                                                                                                                        |

## Appendix F Further information

### F.1 Product and service queries

Should you have any queries about the product, contact the local INVT office. Provide the model and serial number of the product you query about. You can visit [www.invt.com](http://www.invt.com) to find a list of INVT offices.

### F.2 Feedback on INVT VFD manuals

Your comments on our manuals are welcome. Visit [www.invt.com](http://www.invt.com), directly contact online service personnel or choose **Contact Us** to obtain contact information.

### F.3 Documents on the Internet

You can find manuals and other product documents in the PDF format on the Internet. Visit [www.invt.com](http://www.invt.com) and choose **Service and Support > Data Download**.

Service line: 86-755-23535967 E-mail: overseas@invt.com.cn Website: www.invt.com

The products are owned by **Shenzhen INVT Electric Co.,Ltd.**

Two companies are commissioned to manufacture: (For product code, refer to the 2nd/3rd place of S/N on the name plate.)

**Shenzhen INVT Electric Co., Ltd.** (origin code: 01)

Address: INVT Guangming Technology Building, Songbai Road,  
Matian, Guangming District, Shenzhen, China

**INVT Power Electronics (Suzhou) Co., Ltd.** (origin code: 06)

Address: 1# Kunlun Mountain Road, Science&Technology Town,  
Gaixin District, Suzhou, Jiangsu, China
