SJ700N SERIES

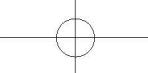

Easy control with powerful performance
Humanization design and environmental compatible

THE
NEW

Powerful Inverter

SJ700N

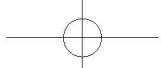

進化

Easy control! Powerful performance!

- High Starting Torque
- Easy Operation
- Advanced Performance

【Powerful】

High Starting Torque

- High starting torque of 200% or more at 0.3HZ.
- Smooth operation with simple adjustment.

CONTENTS

Characteristics 3-6

Standard Specifications 7-9

Dimensions 10-12

Operation 13

Function List 14-22

Terminals 23-24

Protective Function 25

Connecting Diagram 26

Connection to PLC 27

Wiring and Accessories 28

For Correct Operation 29-30

【Saving】

Cost Effective

- Built-in EMC Filter up.
- Integrated brake unit.
- Saving installation space and total cost of the system.

【Easy】

Ten Years of Lifespan

Easier Maintenance

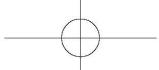

- High quality components with lifetime warning functions. The inverter can be easily maintained or replaced.

【Environmental】

- Varnish coating on internal PCB and nickel-plated treatment of the circuit copper bus-bar meet environmental standards.

Powerful Inverter SJ700N

2

EASY AND POWERFUL

Promoted Performance

applied for models lower than 132kW

1 PM motor control

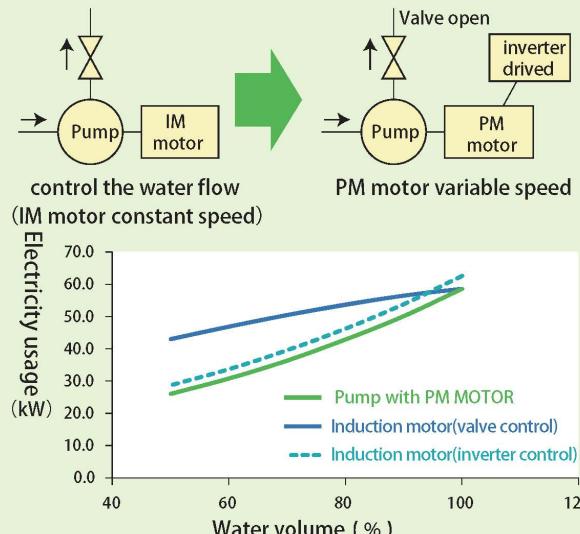

PM and IM motor compatible, which largely reduces the cost of stocks. Better energy saving performance when applied with synchronous motor.

Newly developed auto tuning function features more widely applications, which can easily detect the parameters of models from different brands.

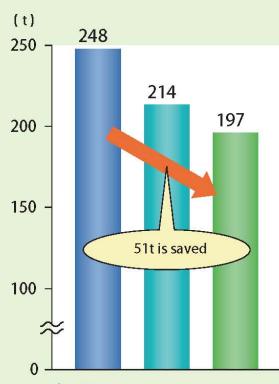

ENERGY SAVING BY USING PM MOTOR

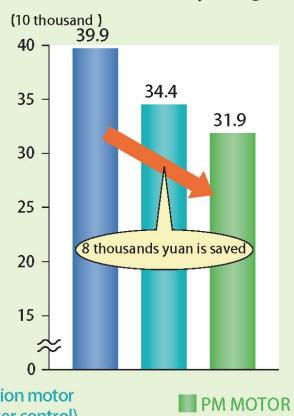

ENERGY SAVING of THE PUMP

Annual release of CO₂

Annual electricity usage

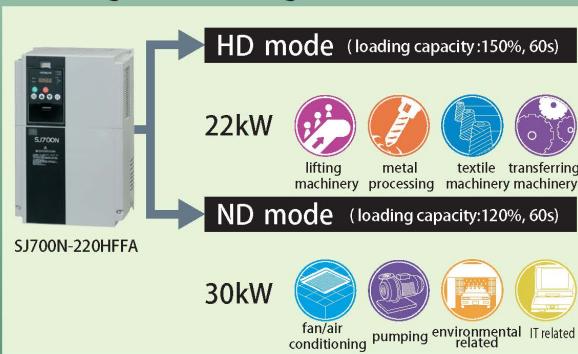

[Conditions]

- HOV centrifugal pump 55kW, high efficient PM motor and full closed external fan type IM motor.
- Annual operation time 8000 hours (100% flow,2000 hours, 70% flow,6000 hours)
- Electricity fee: 1yuan/kWh, CO₂ release volume: 0.53kg CO₂/kWh

2 Double rated

Heavy load and normal load compatible, which automatically choose the proper inverter according to the loading characteristics

3 RS485 (Modbus-RTU) communication speed is promoted by 6 times

- Communication speed maximum 115.2kbps
- EEPROM writing function is added
- Broadcasting function is added
- Command range is increased from 8 bytes to 32 bytes

4 EzSQ processing speed is promoted by 5 times

- More quickly feedback to meet different applications
- Processing speed: 1 command/2ms → 5 commands/2ms
 - EEPROM writing command, real-time clock command are added
 - Data stored at power off

ENVIRONMENTAL FRIENDLY

5 LCD operator (optional)

- LCD screen which displays five lines of data
- Two kinds of background color which exchanges according to the state of the inverter
- 4 groups of user data can be stored(or 1 group of parameter + EzSQ program)
- Internal real time clock
- 10 kinds of languages

6 More functions are added

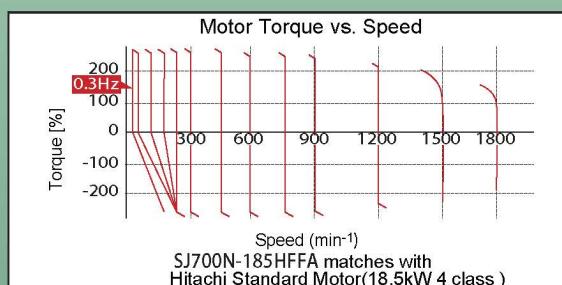

- Output phase loss detection
- Initial screen selection
- Automatically back to the Initial screen
- Data written selection
- Operating mode monitoring
- Increased methods for initiation

Powerful Operation

Starting Torque of 200% or More at 0.3Hz

Hitachi specialized technology of Sensorless Vector Control and Auto Tuning contributes to a high starting torque of 200% or more at 0.3Hz.

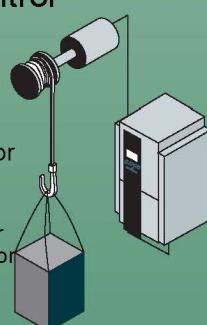

- Much easier to set up the parameters
- Widely used in cranes, lifts, extruders and ect which need high torque to start at low speed

Hitachi Exclusive 0Hz Domain Sensorless Vector Control

The exclusive 0Hz domain sensorless vector control technology makes it possible to develop 150% torque at 0Hz speed reference, which is ideal for lifts that require high torque to start.

* Under the condition that the inverter is one frame size larger than the motor

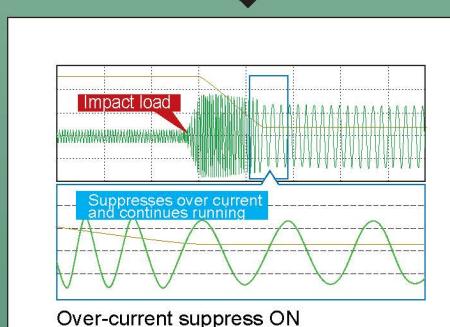

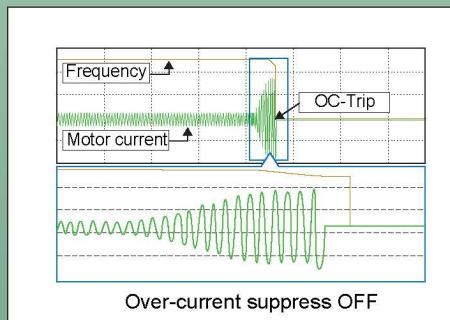

Trip Suppression

Over Current&Voltage Suppress Function

Higher internal calculation speed*improves current control performance. Over-current and over-voltage suppress functions avoid inverter trip during acceleration and deceleration.

Even at sudden acceleration or with impact load, the inverter keeps operating and reduces trip times.

*Three times faster than previous models

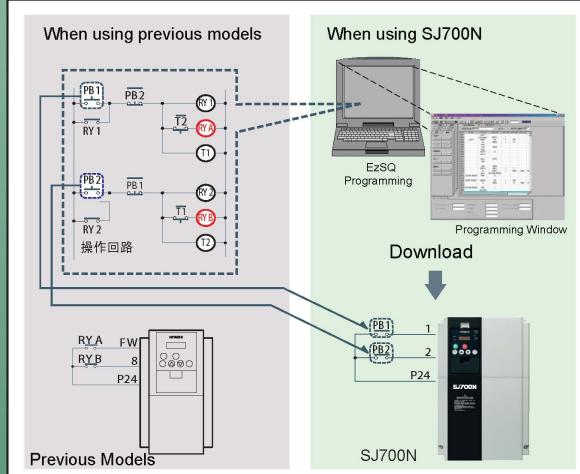

Programming Function 【EzSQ】

Inverter Control by Built-in Programming Function

EzSQ operation allows users to develop certain functions which previous models don't have. And significant cost will be saved by simplifying and eliminating external hardware. The password protection is incorporated to prevent proprietary program data from loss or unauthorized modification.

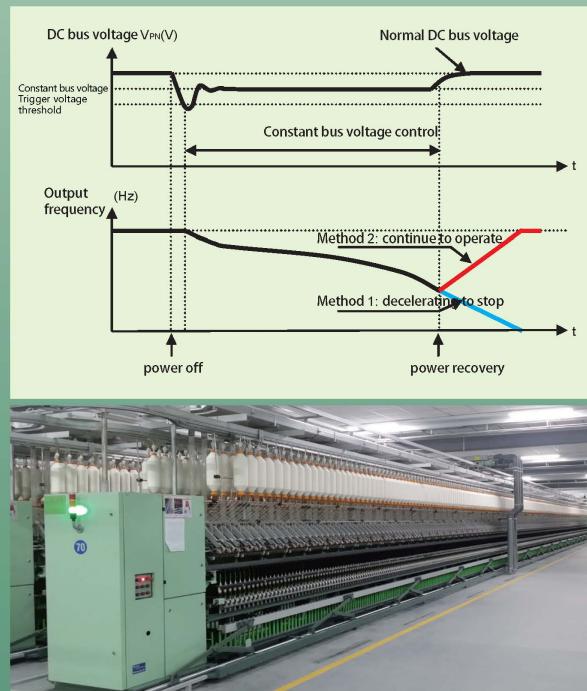

Examples of Application - Relay Unit Control Sequence
The inverter is controlled by EzSQ programming instead of by external relay unit

Decelerating Stops at Power off

Decelerating to stop at power off and restoring to operate during power recovery

The inverter will decelerate until stop by keep the voltage of the main circuit DC section at a constant value when external power supply is turned off. This function is ideal for textile and rolling machinery which have a strict requirement for constant pulling force.

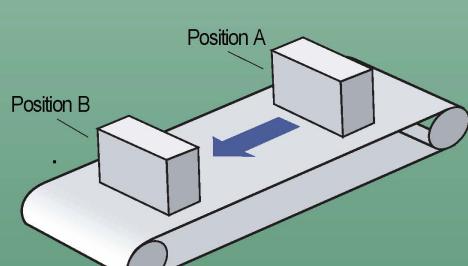

Position Control

Absolute Position Control Function

The SJ700N, with optional feedback board of SJ-FB installed, together with a general purpose motor can perform position control. For application such as position control of conveyor, performance can be achieved at a lower cost. Based on the four motion parameters (position command, speed command, acceleration time and deceleration time), the SJ700N will move an object from original position A to target position B.

After the movement, the inverter keeps servo lock status.

Rich Kinds of Components

EMC Filter Integrated to Reduce Noise

EMC filter and 0 phase reactor are applied which effectively reduced the radiation noise. The inverter meets the EN61800-3 2nd-Environment

The leakage current will be increased with the EMC filter on, so please use proper sensitivity current for residual current circuit breaker

Leakage Current of EMC Filter(EMC Filter ON/OFF)

Value of 3 phase Δ connection and 1 phase ground connection
Input power supplier(400v class: 480v/60Hz)

	400V class	
	18.5~37kW	45~55kW
EMC filter on	56mA	56mA
EMC filter off	0.2mA	0.2mA

The leakage current of EMC on 75~132kW models is very low, so there is no switch on and off.
(Leakage current: 0.2mA)

BRD Circuit

Inserted BRD is extended to be applied in 22kW models, which is more cost and space reduction compared with external braking controller.

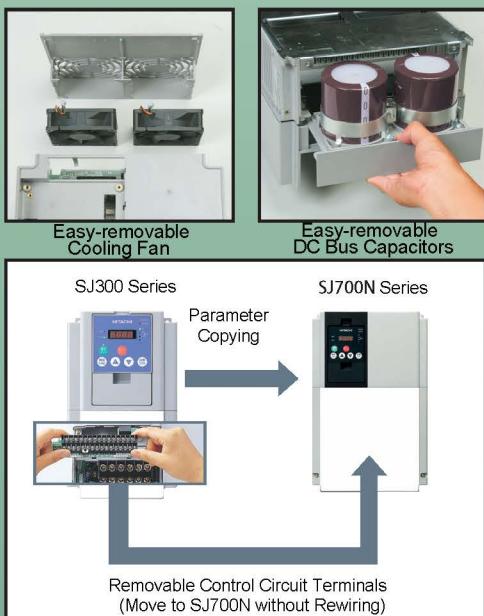

Easy Maintenance

Easy-removable Construction for Maintenance

Endured parts like cooling fans and DC bus capacitors can be quickly replaced on site, which greatly reduces the maintenance time.

Like SJ300 series, the control circuit terminals can be taken off and replaced easily without wiring change.

The parameter of SJ300 can be read and then copied into SJ700N, which greatly saves the operating time.

Durable Components with Longer Lifespan

Components with Long Lifespan

SJ700N is composed of endured components with designed lifespan of 10 years*. Besides, it features cooling fans with ON/OFF switch, which largely extends the inverters lifespan.

* Under average annual temperature of 40°C (at atmosphere of oil free, dust free, mist free and corrosive gases free). The designed lifetime is estimated but not guaranteed.

Lifetime Warning Function

SJ700N sends predictive warnings when the temperature of DC bus capacitor goes up or the cooling fans get aged. It monitors the motor's temperature and alarms to avoid an inverter trip caused by aged components.

Easy Operation

User Selection of Displayed Parameters

Data Comparison Function

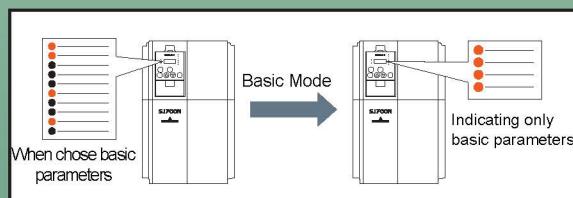

- Allows display of parameters changed from default. Quickly check the correction of parameters and eliminate errors.

User Selection Function

- The display of operator panel can be controlled. Up to 12 user defined parameters U001~U012 can be displayed.

Basic Mode (Default)

- Basic display mode for commonly used parameters.

※ Please refer to page 13 for available parameters for basic mode.

Other Functions

* The direct input of function code is possible rather than scrolling through the list.

* Holding down the function key for 3 seconds, users can change the display to output frequency monitor (d001) mode from any menu location.

Network Compatibility

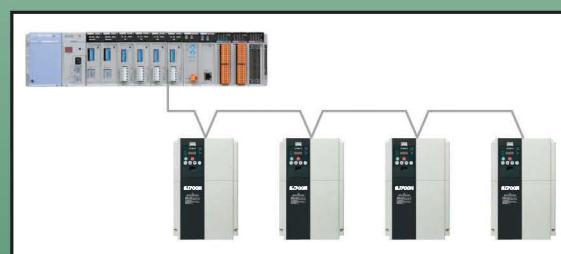

Improving Network Connection

SJ700N is incorporated with Standard RS-485 Modbus-port. It can be connected to open network by optional board such as DeviceNet, PROFIBUS-DP,CC-LINK and so on.

* DeviceNet is the registered trademark of Open DeviceNet Vender Association, Inc

* PROFIBUS-DP is the registered trademark of PROFIBUS Nutzer

* CC-LINK is the trademark of CLPA

Powerful Inverter SJ700N

● General specifications

Item		Specifications
Control	Control mode	Sine-wave PWM control
	Output freq range(note1)	0.1~400.0Hz
	Frequency accuracy	Digital command: maximum frequency $\pm 0.01\%$ Analog command : $\pm 0.2\% (25 \pm 10^\circ C)$
	Frequency resolution	Digital setting: 0.01Hz Analog setting: max freq /4000(O terminal: 12 bits/0~+10V , O2 terminal: 12 bits-10~+10V)
	Voltage/frequency characteristics	V/f characteristic variable with the base frequency set between 30 to 400Hz, constant- or reduced-torque V/f control, sensorless vector control, 0Hz-range sensorless vector control, vector control(use option SJ-FB).
	Rotational speed variation	$\pm 0.5\%$ (sensorless vector control)
	Acc/dec time	0.01~3600sec(in liner or curved pattern) (S, U,reverse -U, EL-S))
	DC braking	Triggered at motor start-up when the motor freq exceeds the freq set by inverter command or by an externally input command
	Standard operator	Setting with Δ / ∇ keys
	External signal (note 4)	O input : DC0~+10V (input impedance 10k Ω) O2 input : DC-10~+10V (input impedance 10k Ω) OI input : 4~20mA (input impedance 100 Ω) Pulse string : 0.1~50.0kHz (5V wire input : SJ-FB is needed)
Frequency setting command	External port	Setting via RS485 communication(Hitachi protocol/Modbus-RTU optional)
	Standard operator	Input via RUN/STOP key(forward and reverse command switch)
	External signal	Forward/reverse 1a/1b switchable, 3 wire input, servo ON signal, pre excitation signal(SLV, 0HzSLV,V2 mode enabled)
	External port	Setting via RS485 communication(Hitachi protocol/ Modbus-RTU optional)
	Terminals	8 open collector terminals, 24V connector
	Function	01(RV: reverse),02(CF1: multispeed 1 setting),03(CF2: multispeed 2 setting),04(CF3: multispeed 3 setting), 05(CF4: multispeed 4 setting), 06(JG: jogging),07(DB: external DC braking),08(SET: second motor control), 09(2CH: 2-stage acc/dec), 11(FRS: free run stop), 12(EXT: external trip), 13(USP: unattended start protection), 14(CS: commercial power supply switch), 15(SFT: software lock), 16(AT: analog input switch), 17(SET3: third motor control), 18(RS: reset), 20(STA: starting by 3 wire input), 21(STP: stopping by 3 wire input), 22(F/R: forward/reverse switching by 3-wire input), 23(PID: PID enable/disable), 24(PIDC: PID integration reset), 26(CAS: cont rol gain switching), 27(UP: acc by remote control), 28(DWN: dec by remote control), 29(UDC: date clearance by remote control), 31(OPE: forcible operation), 32(SF1: multispeed bit 1), 33(SF2: multispeed bit 2), 34(multispeed bit 3), 35(multispeed bit 4), 36(multispeed bit 5), 37(SF6: multispeed bit 6), 38(multispeed bit 7), 39(OLR: overload restriction selection), 40(TL: torque restriction enabled/disabled), 41(TRQ1: torque limit 1), 42(TRQ2: torque limit 2), 43(PPI: PPI switch), 44(BOK: braking confirmation), 45(ORT: orientation), 46(LAC: LAD cancellation), 47(PCLR: clearance of position deviation), 48(STAT: pulse train input permission), 50(ADD: trigger for frequency addition [A145]), 51(F-TM: forcible-terminal operation), 52(ATR: permission of torque command input), 53(KHC: cumulative power clearance), 54(SON:servo-on), 55(FOC: pre-excitation), 56(MI1: general-purpose input 1), 57(MI2: general-purpose input 2), 58(MI3: general-purpose input 3), 59(MI4: general-purpose input 4), 60(MI5: general-purpose input 5), 61(MI6: general-purpose input 6), 62(MI7: general-purpose input 7), 63(MI8: general-purpose input 8), 64(EMC: emergency stop signal), 65(AHD: analog command holding), 66(CP1: multistage position settings selection 1), 67(CP2: multistage position settings selection 2), 68(CP3: multistage position settings selection 3), 69(ORL:Zero-return limit function), 70(ORG: Zero-return trigger function), 71(FOT: forward drive stop), 72(ROT: reverse drive stop), 73(SPD: speed / position switching), 74(PCNT: pulse counter), 75(PCC: pulse counter clear), no (NO: no assignment)
	Thermistor input terminal	1 terminal(positive temperature coefficient/negative temperature coefficient switchable for resistor)
	Emergency stop input terminal	Not forcibly cut the output via CPU
Input signal	Terminals	5 open collector terminals (24Vdc 50mA max) 1 relay(1C contact) terminal
	Function	00(RUN:Running),01(FA1:constant-speed reached),02(FA2: set frequency overreached),03(OL:overload notice advance signal),04(OD:output deviation for PID),05(AL:alarm signal),06(FA3: set frequency reached),07(OTQ:over-torque),08(IP:instantaneous power failure),09(UV:under voltage),10(TRQ:torque limited),11(RNT:Operation time over),12(ONT: plug-in time over),13(THM:thermal alarm signal),19(BRK:brake release),20(BER:Braking error),21(ZS:0Hz detection signal),22(DSE:speed deviation maximum), 23(POK:positioning completed), 24(FA4: Set frequency overreached 2), 25(FA5: set frequency reached 2), 26(OL2:overload notice advance signal 2),27(ODC:analog O disconnection detection), 28(OIDC: analog OI disconnection detection),29(O2DC: analog O2 disconnection detection),31(FB-V:PID feedback comparison), 32(NDc:communication disconnection detection),33(LOG1:logical operation result 1), 34(LOG2: logical operation result 2), 35(LOG3:logical operation result 3), 36(LOG4: logical operation result 4), 37(LOG5:logical operation result 5), 38(LOG6:logical operation result 6), 39(WAC:capacitor life warning),40(WAF:cooling-fan speed drop),41(FR:starting contact signal),42(OHF:heat sink overheat warning),43(MO1: general output 1), 44(MO2: general output 2), 45(MO3: general output 3),46(MO4: general output 4),47(MO5: general output 5),48(MO6: general output 8),49((LOC:low-current indication signal), 55(WCO1:window comparison function OI),56(WCO2>window comparison function O2)
	Intelligent input	When specify alarm mode by C062, intelligent output terminal 11-13 or 11-14 will be forcibly assigned to AC0-AC2 or AC0-AC3(AVn: alarm code output)
Output signal	Other Function	AM terminal(0~10Vdc:output resolution 10 bits)AMI terminal(4~20mA: output resolution 10 bits)FM terminal(pulse train output), output frequency, output current, output torque, output voltage, input voltage, thermal load ratio, LAD frequency, digital output frequency: only FM, motor moisture, heat temperature, digital output current: only FM, output torque with symbol: only AM
	Monitoring output	Output frequency ,output current, output voltage, out torque, ID feedback, operation direction, intelligent input status, intelligent output terminal status, input voltage, accumulative RUN time, accumulative power ON time, trip display, alarm display, motor moisture, heat temperature, program counter, accumulative voltage, active rotation number, actual frequency, torque command, torque bias, life diagnose, program code, position command, current position, DC bus voltage, BED load ratio, thermal load ratio
	Operator monitoring display	V/f free setting (7breakpoints), frequency upper/lower limit, jump center frequency, manual torque boost level/breakpoint, auto torque boost level, energy saving operation, analog meter adjustment, gain adjustment, acceleration/deceleration according to characteristic curve, overcurrent suppress, thermal protection free setting, external start/end(frequency/rate), restart after instantaneous power failure, restart at instantaneous current input, PID control function, analog input operation, automatically deceleration at power off, overvoltage suppression at deceleration, auto tuning function (online , offline, for 10 P motor), EzSQ programming.
Function		Overcurrent, overload, BRD overload, overvoltage, EEPROM error, undervoltage, CT error, CPU error, external trip, USP, grounding error, overvoltage input, instantaneous power failure, temperature error, gate array communication error, input phase absent, IGBT error, thermistor resistor error, emergency power off, low speed overload, program operation error, program operation command error, program runs nested error
Ambient environment	Storage temperature / humidity(note2)	-20~65°C (short time for transport/20~90%RH(no condensation allowed)
Option	Application	Altitude under 1,000m, indoor (environment without corrosive gases and dust) (Note 5)
	Internal option	Feedback board(vector control with sensor), digital input board(4 bits BCD, 16 bits binary) DeviceNet PANEL, LonWorks panel, PROFIBUS panel
	Others	Braking resistor, AC reactor, DC reactor, noise filter, operator cables, harmonic-wave suppressor unit ,LCR filter, analog operation panel, controllers for applications regenerative braking unit, controllers for various applications

Note1:When the motor is operating at frequency over 50/60Hz, please pre-acknowledge maximum allowable rotation number of the inverter.

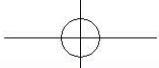

Note2:The storage temperature refers to the temperature during transport.

Note3:The insulation distance is in line with CE standard

Note4: The frequency command will equal the maximum frequency at 9.8V for input voltage DC0~10V,or at 19.6mA for input current 4~20mA.If this characteristic is not satisfactory for your application,contact your sales representative.

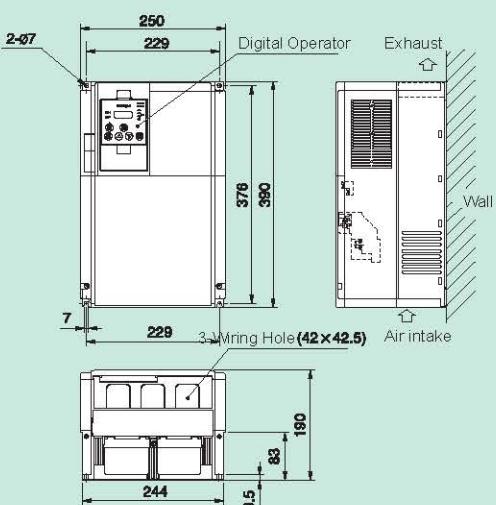

Note5: The density of air decreases by 1% whenever rising by 100m when the altitude exceeds 1000m,

Please inquire about using in the high ground of 2500m or more.

Operation

SJ700N Series can be easily operated with the digital operator provided as standard. It can also be operated by a LCD operator WOP (optional) with remote control function and copy function.

• Instructions

Setting the output frequency

● The default setting is basic display for 160~315kW models
To display all parameters, specify "00" for "b037"

No.	Display Code	Items
1	d001~104	Monitor display
2	F001	Output frequency setting
3	F002	Acceleration (1) time setting
4	F003	Deceleration (1) time setting
5	F004	Operation direction setting
6	A001	Frequency source setting
7	A002	Run command source setting
8	A003	Base frequency setting
9	A004	Maximum frequency setting
10	A005	[AT] selection
11	A020	Multi-speed frequency setting
12	A021	Multi-speed 1 setting
13	A022	Multi-speed 2 setting
14	A023	Multi-speed 3 setting
15	A044	1st control method
16	A045	Vf gain setting
17	A085	Operation mode selection
18	b001	Selection of restart mode
19	b002	Allowable under-voltage power failure time
20	b008	Selection of retry after tripping
21	b011	Retry wait time after trip
22	b037	Function code display restriction
23	b083	Carrier frequency setting
24	b084	Initialization mode selection
25	b130	Ovenvoltage suppression function enabled
26	b131	Ovenvoltage suppression level
27	C021	Setting of intelligent output terminal 11
28	C022	Setting of intelligent output terminal 12
29	C036	Alarm relay active state

Function List

The operator displays the content of d001. If you want to display other parameters under default set, please change the setting of b038.
To enable the parameters to be changed while the inverter is operating, specify "10" for the software lock mode selection (b031).
The grey parts displays the default values of 160~350kW models under basic mode. To enable the display of all parameter, specify "00" full display for the function code display restriction (b037).

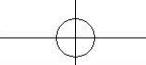

● Monitoring Mode

Code	Function name	Monitored data or setting	Default	Setting during operation (allowed or not)	Change during operation (allowed or not)

ROTO terminals (All models)	M4		9

(*1) When connected with bare wire instead of crimping terminal, please use the angle washer provided in the product package.

● Terminal Arrangement

(2) Control Circuit Terminals

● Terminal Description

	Symbol	Name	Explanation of Terminals	Characteristics
Analog	Power Supply	L	Common Terminal for Analog Power Source	—
		H	Power Source for Frequency Setting	DC 10V, 20mA max
	Frequency Setting	O	Frequency Command Terminal(Voltage)	Maximum frequency is attained at DC 10V in DC 0-10V range. Set the voltage at
		O2	Frequency Command Extra Terminal(Voltage)	O2 signal is added to the frequency command of O or O1 in DC 0-±10V range. By changing configuration, frequency command can be input also at O2 terminal.
	Output Monitor	O1	Frequency Command Terminal (Current)	Maximum frequency is attained at DC 20mA in DC 4-20mA range. When the intelligent terminal configured as AT is on, O1 signal is enabled.
		AM	Analog Output Monitor (Voltage)	Selection of one function from: Output frequency, output current, torque, output voltage, input power, electronic thermal load ratio, and LAD frequency, motor temperature, heat sink temperature, common output terminals.
		AMI	Analog Output Monitor (Current)	DC0-10V, 2mA max.
	Monitor Output	FM	Digital Monitor (Voltage)	DC4-20mA, 250Ω max.
		P24	Power Terminal for Interface	[DC0-10V output (PWM output)] Selection of one function from: Output frequency, output current, torque, output voltage, input power, electronic thermal load ratio, and LAD frequency, motor temperature, heat sink temperature, common output terminals. [Digital pulse output (Pulse voltage DC 0/10V)] Outputs the value of output frequency as digital pulse (duty 50%)
Digital(contact)	Power Supply	CM1	Common Power Terminalfor Interface	Internal power supply for input terminals. In the case of source type logic, common terminal for contact input terminals.
		FW	Forward Command Input	Common terminal for P24, TH, and FM. In the case of sink type logic, common terminal for contact input terminals. Do not ground.
	Run Functions	1~8	Intelligent Input Terminals	The motor runs forward when FW terminal is ON, and stops when FW is OFF.
		PLC	Common Terminal for Intelligent Input Terminals	Assign 8 functions to terminals. Terminal 1 and 3 is for urgent stop,
	Status	11~15	Intelligent Output Terminals	[Input ON condition] Voltage between each terminal and PLC: DC 18V min. [Input OFF condition] Voltage between each terminal and PLC: DC 3V max. Input impedance between each terminal and PLC: 4.7Ω
		CM2	Common Terminal for Intelligent Output Terminals	Select sink or source logic with the short-circuit bar on the control terminals. Sink logic: Short P24 to PLC / Source logic: Short CM1 to PLC. When applying external power source, remove the short-circuit bar and connect PLC terminal to the external device.
	Analog Input	Open Collector	11~15	Assign 5 functions to open collector outputs. When the alarm code is selected at C062, terminal 11-13 or 11-14 are reserved for error codes of inverter trip. (Refer to the standard specifications for the functions.) Both sink and source logic are always applicable between each terminal and CM1.
		TH	Thermistor Input Terminals	Decrease in voltage between each terminal and CM2: 4V max. during ON
	Digital	Sensor	CM2	Common terminal for intelligent output terminal 11-15.
		State/ Alarm	AL0 AL1 AL2	Allowable maximum voltage: DC 27V Allowable maximum current: 50mA

Protective Function

Error Codes

Name	Description	Display on digital operator	Display on WOP
Over-current protection	The inverter output was short-circuited, or the motor shaft is locked or has a heavy load. These conditions cause excessive current for the inverter, so the inverter output is turned off.	Constant speed	E01.□
		During dec	E02.□
		During acc	E03.□
		Others	E04.□
Overload protection(*1)	When a motor overload is detected by the electronic thermal function, the inverter trips and turns off its output.	E05.□	Over.L
Braking resistor overload protection	When the regenerative braking resistor exceeds the usage time allowance or an over-voltage caused by the stop of the BRD function is detected, the inverter trips and turns off its output.	E06.□	OL.BRD
Over-voltage protection	When the DC bus voltage exceeds a threshold, due to regenerative energy from the motor, the inverter trips and turns off its output.	E07.□	Over.V
EEPROM error(*2)(*3)	When the built-in EEPROM memory has problems due to noise or excessive temperature, the inverter trips and turns off its output.	E08.□	EEPROM
Under-voltage error	A decrease of internal DC bus voltage below a threshold results in a control circuit fault. This condition can also generate excessive motor heat or cause low torque. The inverter trips and turns off its output.	E09.□	Under.V
CT(Current transformer) error	If a strong source of electrical interference is close to the inverter or abnormal operations occur in the built-in CT, the inverter trips and turns off its output.	E10.□	CT
CPU error	When a malfunction in the built-in CPU occurs, the inverter trips and turns off its output.	E11.□	CPU
External trip	When a signal to an input terminal configured as EX has occurred, the inverter trips and turns off its output.	E12.□	EXTERNAL
USP error	An error occurs when power is cycled while the inverter is in RUN mode if the Unattended Start Protection (USP) is enabled. The inverter trips and does not go into RUN mode until the error is cleared.	E13.□	USP
Ground fault	The inverter is protected by the detection of ground faults between the inverter output and the motor during power-up tests. This feature protects the inverter only.	E14.□	GND.Fit
Input over-voltage protection	When the input voltage is higher than the specified value, it is detected 60 seconds after power-up and the inverter trips and turns off its output.	E15.□	OV.SRC
Instantaneous power failure	When power is cut for more than 15ms, the inverter trips and turns off its output. If power failure continues, the error will be cleared. The inverter restarts if it is in RUN mode when power is cycled.	E16.□	Inst.P-F
Temperature error due to low cooling fan speed	The inverter will display the error code shown on the right if the lowering of cooling-fan speed is detected at the occurrence of the temperature error described below.	E20.□	OH.stFAN
Inverter thermal trip	When the inverter internal temperature is higher than the specified value, the thermal sensor in the inverter module detects the higher temperature of the power devices and trips, turning off the inverter output.	E21.□	OH.fin
Gate array error	Communication error has occurred between CPU and gate array.	E23.□	GA.COM
Input phase loss detection	Specify phase loss selection b006 as 01, trip will occur to avoid inverter damage. When phase loss time continues for over 1 second, the inverter trips.	E24.□	PH.fail
Main circuit error (*3)	The inverter will trip if the gate array cannot confirm the on/off state of IGBT because of a malfunction due to noise or damage to the main circuit element.	E25.□	Main.Cir
Cooling-fan speed drop signal	If the rotation speed of the internal cooling fan decreases so that the cooling effect decreases, inverter outputs turn OFF for protection.	E29.□	Fan.Slow
IGBT error	When an instantaneous over-current has occurred, the inverter trips and turns off its output to protect main circuit element.	E30.□	IGBT
Output phase loss protection(*5)	Specify output phase loss selection b141 as 01, trip will occur to avoid inverter damage. Detecting with output frequency range within 5~100HZ.	E34.□	PH.fail
Thermistor error	When the thermistor inside the motor detects temperature higher than the specified value, the inverter trips and turns off its output.	E35.□	TH
Braking error	The inverter turns off its output when it can not detect whether the braking is ON or OFF within waiting time set at b024 after it has released the brake. (When braking is enabled at b120)	E36.□	BRAKE
Emergency stop(*4)	If the EMR signal (on three terminals) is turned on when the slide switch (SW1) on the logic board is set to ON, the inverter hardware will shut off the inverter output and display the error code shown on the right.	E37.□	EMR
Low-speed over-load protection	If overload occurs during the motor operation at a very low speed at 0.2 Hz or less, the electronic thermal protection circuit in the inverter will detect the overload and shut off the inverter output. (2nd electronic thermal control) (Note that a high frequency may be recorded as the error history data.)	E38.□	OL-LowSP
Modbus communication error	If timeout occurs because of offline disconnection during the communication in Modbus-RTU mode, the inverter will display the error code shown on the right. (The inverter will trip according to the setting of C076.)	E41.□	NET.ERR
User trip 0~9	Error will be displayed in case of trip	E50.□~E59.□	PRG-0~PRG-9
Option error 1	Refer to the manual instructions	E60.□~E69.□	OP1-0~OP1-9
Option error 2	Refer to the manual instructions	E70.□~E79.□	OP2-0~OP2-9
Easy sequence function Error	Error indications by protective functions with the easy sequence function used	E43.□ E44.□ E45.□	PRG.CMD PRG.NST PRG.ERR1

(*1): Reset operation is acceptable 10 seconds after the trip.

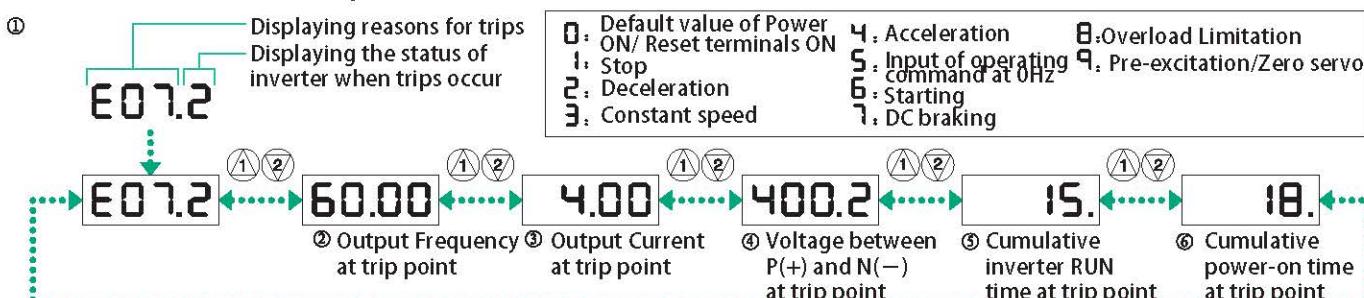

(*2): Check the parameters when EEPROM error E08 occurs. If EEPROM errors reoccur after power on, please reset the parameters after default.

(*3): The inverter will not accept reset commands input via the RS terminal or entered by the STOP/RESET key. Therefore, turn off the inverter power.

(*4): The inverter will not accept the reset command entered from the digital operator. Therefore, reset the inverter by turning on the RS terminal.

(*5): This protection function is only for SJ700N-185~1320HFFA.

Method to Monitor Trips

Note: This is the status during an inverter trip, not the actual status of the motor.

Eg: Under PID control command or analog signal(voltage/current) input frequency command, the motor is operating at constant speed, but the inverter displays imperceptible acceleration/deceleration because of the fluctuation of analog signals.

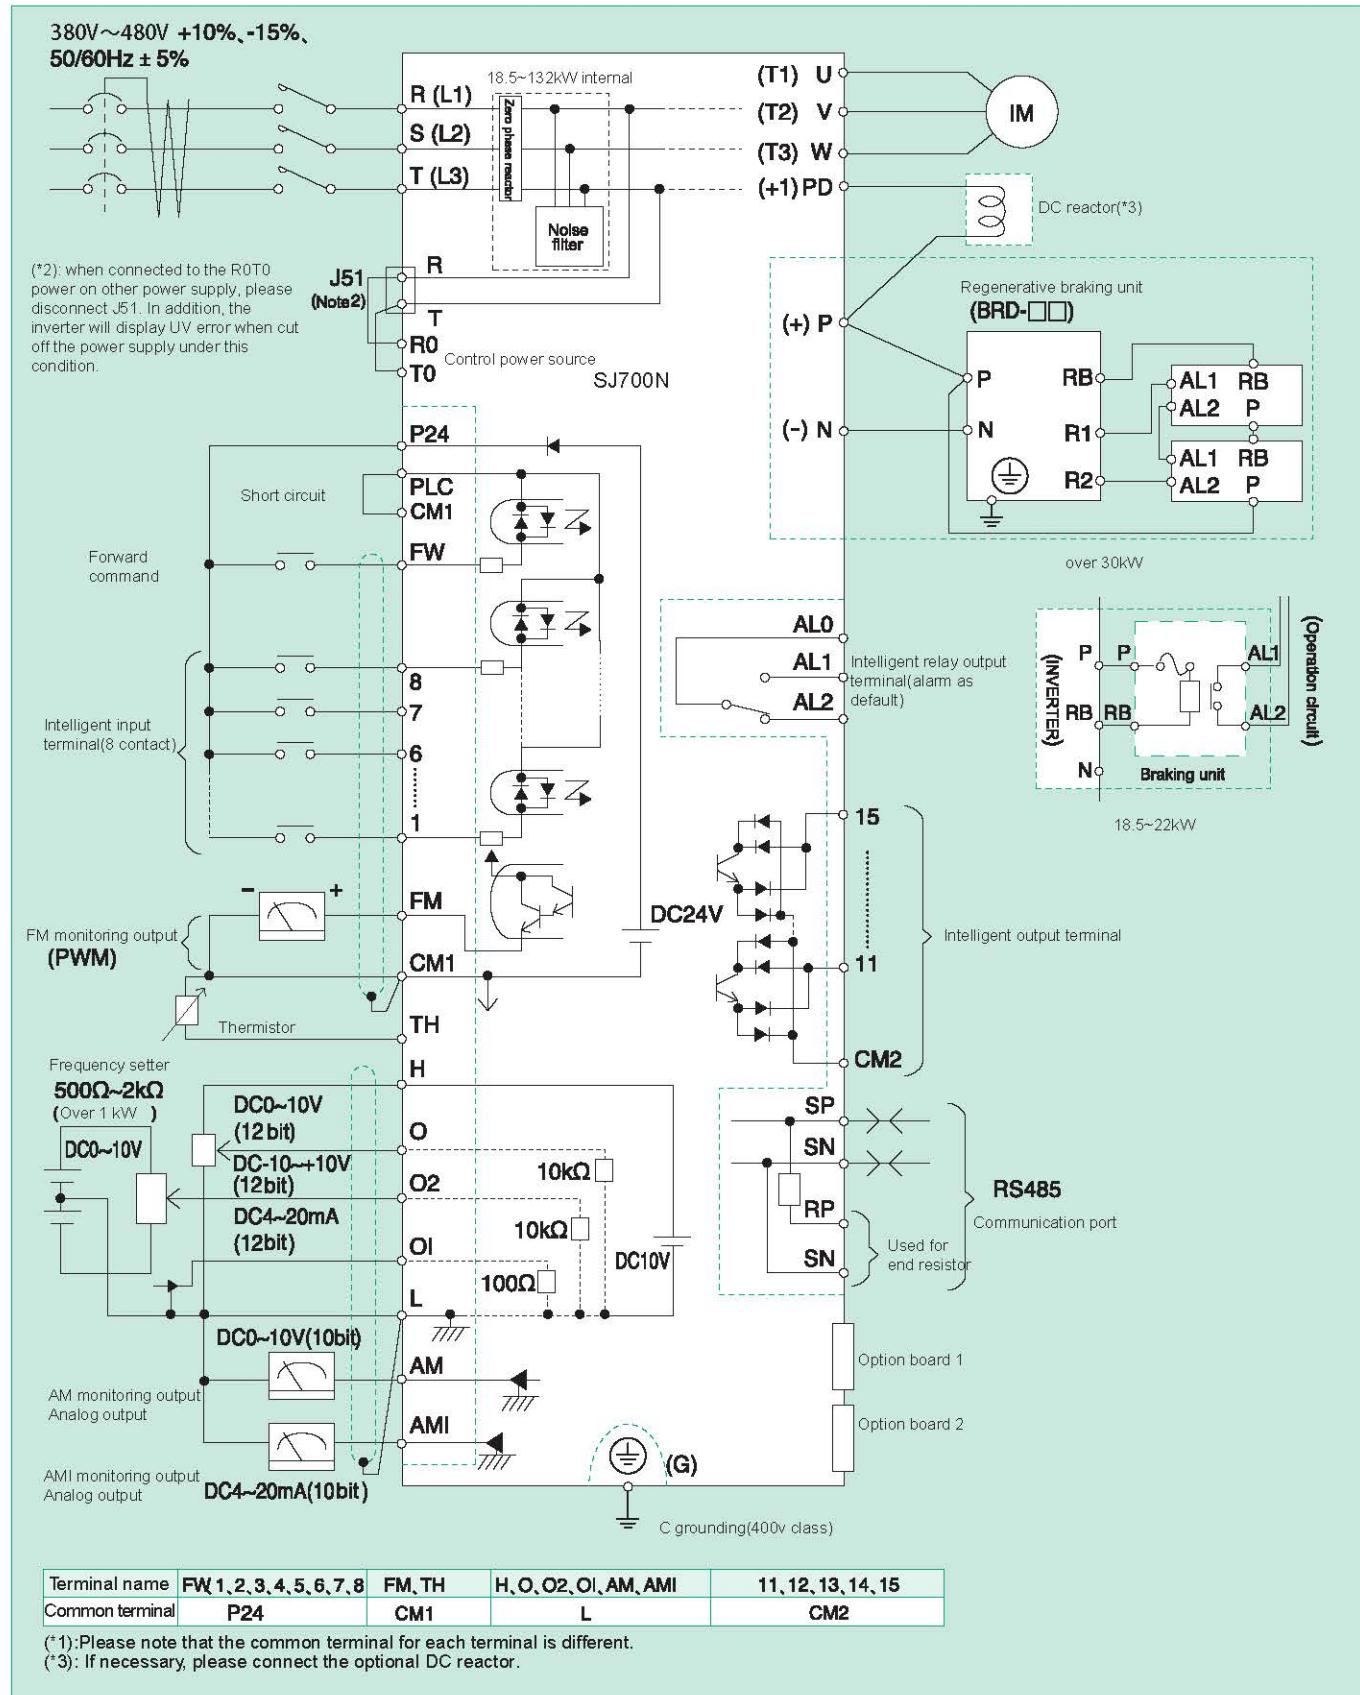

Under such circumstance, the actual status of the motor displayed on the operator is different from the status displayed during an inverter trip.

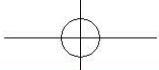

Connecting Diagram

● Standard connection(source logic)

400V class example

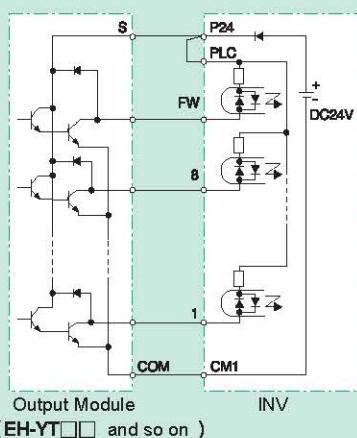

Connection to PLC

Connection to the Module of Hitachi HIDIC-H Series

● Connection to Input Terminals

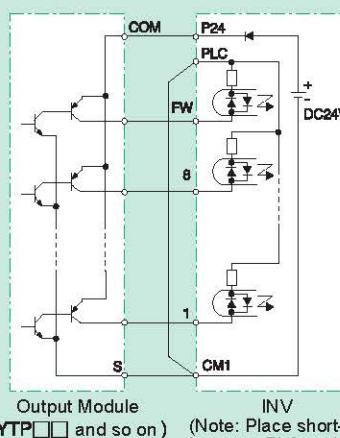

1. Using Internal Power Supply of The Inverter

1) Sink type logic

Output Module
(EH-YT□□ and so on)

2) Source type logic

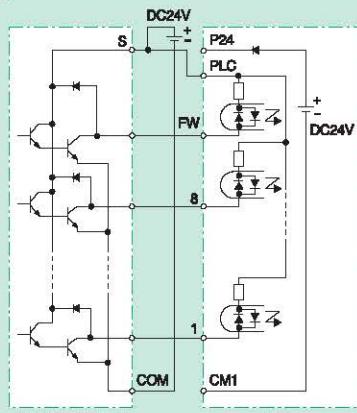

Output Module
(EH-YTP□□ and so on)

(Note: Place short-circuit bar between PLC and CM1 instead of P24 and PLC)

2. Using External Power Supply

1) Sink type logic

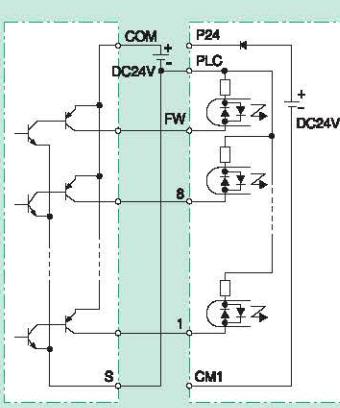

Output Module
(EH-YT□□ and so on)

(Note: Take off the short-circuit bar between PLC and P24)

(Note: Be sure to turn on the inverter after turning on the PLC and its external power source to prevent the parameters in the inverter from being modified.)

2) Source type logic

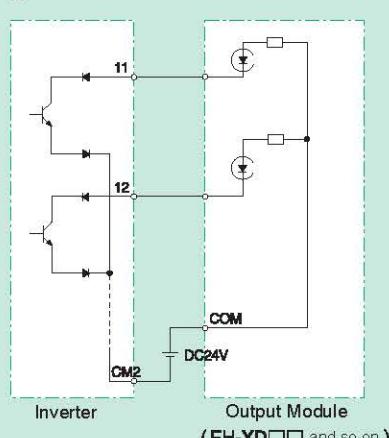

Output Module
(EH-YTP□□ and so on)

(Note: Take off the short-circuit bar between PLC and P24)

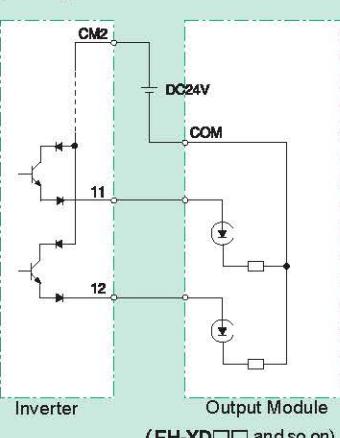

● Connection to Output Terminals

1) Sink type logic

Output Module
(EH-XD□□ and so on)

2) Source type logic

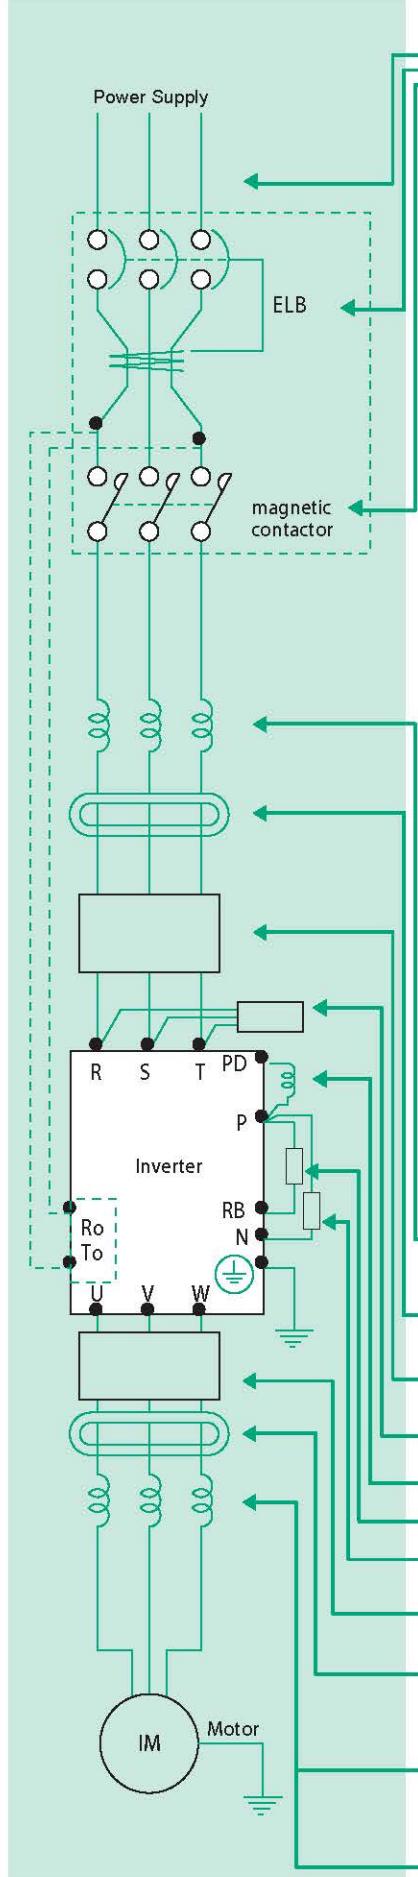

Output Module
(EH-XD□□ and so on)

Wiring and Accessories

● Standard Wiring and Accessories

Model	Motor Output (kW)	Wiring			Accessories	
		AWG (mm ²) R,S,T,U,V,W,P,PD,N	External Braking Resistor P-RB (mm ²)	Signal Lines	Leakage Breaker (ELB)	Magnetic Contactor (MC)
SJ700N-185HFFA	18.5	14	14		EX60B(60A)	HK50
SJ700N-220HFFA	22	14	14		RX100(75A)	HK50
SJ700N-300HFFA	30	22	-		RX100(100A)	H65
SJ700N-370HFFA	37	38	-		RX100(100A)	H80
SJ700N-450HFFA	45	38	-		RX225B(150A)	H100
SJ700N-550HFFA	55	60	-		RX225B(175A)	H125
SJ700N-750HFFA	75	100(38 x 2)	-		RX225B(225A)	H150
SJ700N-900HFFA	90	100(38 x 2)	-		RX225B(225A)	H200
SJ700N-1100HFFA	110	150(60 x 2)	-		RX400B(350A)	H250
SJ700N-1320HFFA	132	200(80 x 2)	-		RX400B(350A)	H300
SJ700N-1600HFFA	160	200(80 x 2)	-		RX400B(350A)	H400C
SJ700N-1850HFFA	185	150 x 2 (note 8)	-		RX600B(400A)	H400C
SJ700N-2200HFA	220	150 x 2	-		RX800B(700A)	H600C
SJ700N-2600HFA	260	150 x 2	-		RX800B(700A)	H800C
SJ700N-3150HFA	315	200 x 2	-		RF-1000CBN(1000A)	H800C

Note1: The accessories are specially used in Hitachi 4 pole squirrel-cage motor

Note2: Please use the breaker with proper capacity (inverter compatible circuit breaker)

Note3: Be sure to use thick wire cable for power wiring if the distance exceeds 20m (66ft)

Note4: Be sure to use ELB to ensure safety

Note5: It is recommended to use heat resisting insulated wire(75°C)

Note6: AWG R,S,T,U,V,W (100mm²) *2

Note7: The diameter for the wire is designed based on HIV wire(heat resisting 75°C)

Note8: For P terminal wire, please refer to the manual for regenerative braking unit

For alarm output contact, please use 0.75mm² wire

Please choose the current sensitivity according to the equivalent value of inverter-power source distance and inverter-motor distance.(④)

④	Current Sensitivity (mA)
100m and below	50
300m and below	100

[When the accessory wire is over 100m, please use CV wire instead. Because the leakage current of the HIV wire is 8 times higher than that of the CV wire. The current sensitivity is as following.(Please use 8 times higher current sensitivity when using HIV wire.)]

Name	Effectiveness				Function
	Radiated Noise	Conducted Noise	Harmonics Noise	Surge Voltage Suppress	
Input side AC reactor (AL1- □□□ 2)		△	○		This is useful in suppressing harmonics induced on the power supply lines, or when the main power voltage imbalance exceeds 3% (and power source capacity is more than 500kVA), or to smooth out line fluctuations. It also improves the power factor.
EMI filter (ZCL- □)	○	△			Reduces the conducted noise on the power supply wiring generated by the inverter. Connect to the inverter input side.
Radio noise filter (NF- □□□)	○	○			Electrical noise interference may occur on nearby equipment such as a radio receiver. This magnetic choke filter helps reduce radiated noise (can also be used on output).
Capacitor filter (CF1- □)	○	△			This capacitor filter reduces radiated noise from the main power wires in the inverter input side.
DC link choke (DCL- □ - □□)			○		Suppresses harmonics generated by the inverter.
Braking resistor					
Regenerating braking unit (BRD- □□□)					This is useful for increasing the inverter's control torque for high duty-cycle (on-off) applications, and improving the decelerating capability.
Output side noise filter (ACF-C □)	○	○		△	Reduces radiated noise from wiring in the inverter output side.
Radio noise filter (Zero Reactor) (ZCL- □□□)	○	△			Electrical noise interference may occur on nearby equipment such as a radio receiver. This magnetic choke filter helps reduce radiated noise (can also be used on input).
Output side AC reactor (ACL- □ 2- □□□)		△			This reactor reduces the vibration in the motor caused by the inverter's switching waveforms, by smoothing the waveforms to approximate commercial power quality. It is also useful when wiring from the inverter to the motor is more than 10m in length, to reduce harmonics.
LCR filter	△	○		○	Sine wave shaping filter for the output side.

For Correct Operation

- Before use, be sure to read through the Instruction Manual to insure proper use of the inverter.
- Note that the inverter requires electrical wiring; a trained specialist should carry out the wiring.
- The inverter in this catalog is designed for general industrial applications. For special applications in fields such as aircraft, outer space, nuclear power, electrical power, transport vehicles, clinics, and underwater equipment, please consult with us in advance.
- For application in a facility where human life is involved or serious losses may occur, make sure to provide safety devices to avoid damages.
- The inverter is intended for use with a three-phase AC motor. For use with a load other than this, please consult with us.

Application to Motors

< Application to general-purpose motors >

Operating frequency	The overspeed endurance of a general-purpose motor is 120% of the rated speed for 2 minutes (JIS C4 004). For operation at higher than 60Hz, it is required to examine the allowable torque of the motor, useful life of bearings, noise, vibration, etc. In this case, be sure to consult the motor manufacturer as the maximum allowable rpm differs depending on the motor capacity, etc.
Torque characteristics	The torque characteristics of driving a general-purpose motor with an inverter differ from those of driving it using commercial power (starting torque decreases in particular). Carefully check the load torque characteristic of a connected machine and the driving torque characteristic of the motor.
Motor loss and temperature increase	An inverter-driven general-purpose motor heats up quickly at lower speeds. Consequently, the continuous torque level (output) will decrease at lower motor speeds. Carefully check the torque characteristics vs speed range requirements.
Noise	When run by an inverter, a general-purpose motor generates noise slightly greater than with commercial power.
Vibration	When run by an inverter at variable speeds, the motor may generate vibration, especially because of (a) unbalance of the rotor including a connected machine, or (b) resonance caused by the natural vibration frequency of a mechanical system. Particularly, be careful of (b) when operating at variable speeds a machine previously fitted with a constant speed motor. Vibration can be minimized by (1) avoiding resonance points using the frequency jump function of the inverter, (2) using a tire-shaped coupling, or (3) placing a rubber shock absorber beneath the motor base.
Power transmission mechanism	Under continued, low-speed operation, oil lubrication can deteriorate in a power transmission mechanism with an oil-type gear box (gear motor) or reducer. Check with the motor manufacturer for the permissible range of continuous speed. To operate at more than 60 Hz, confirm the machine's ability to withstand the centrifugal force generated.

< Application to special motors >

Gear motor	The allowable rotation range of continuous drive varies depending on the lubrication method or motor manufacturer. (Particularly in case of oil lubrication, pay attention to the low frequency range.)
Brake-equipped motor	For use of a brake-equipped motor, be sure to connect the braking power supply from the primary side of the inverter.
Pole-change motor	There are different kinds of pole-change motors (constant output characteristic type, constant torque characteristic type, etc.), with different rated current values. In motor selection, check the maximum allowable current for each motor of a different pole count. At the time of pole changing, be sure to stop the motor. Also see: Application to the 400V-class motor.
Submersible motor	The rated current of a submersible motor is significantly larger than that of the general-purpose motor. In inverter selection, be sure to check the rated current of the motor.
Explosion-proof motor	Inverter drive is not suitable for a safety-enhanced explosion-proof type motor. The inverter should be used in combination with a pressure-proof explosion-proof type of motor.
Synchronous (MS) motor High-speed (HFM) motor	In most cases, the synchronous (MS) motor and the high-speed (HFM) motor are designed and manufactured to meet the specifications suitable for a connected machine. As to proper inverter selection, consult the manufacturer.
Single-phase motor	A single-phase motor is not suitable for variable-speed operation by an inverter drive. Therefore, use a three-phase motor.

< Application to the 400V-class motor >

A system applying a voltage-type PWM inverter with IGBT may have surge voltage at the motor terminals resulting from the cable constants including the cable length and the cable laying method. Depending on the surge current magnification, the motor coil insulation may be degraded. In particular, when a 400V-class motor is used, a longer cable is used, and critical loss can occur, take the following countermeasures:

- (1) install the LCR filter between the inverter and the motor
- (2) install the AC reactor between the inverter and the motor
- (3) enhance the insulation of the motor coil.

Notes on Use

< Drive >

Run/Stop	Run or stop of the inverter must be done with the keys on the operator panel or through the control circuit terminal. Do not operate by installing a electromagnetic contactor (Mg) in the main circuit.
Emergency motor stop	When the protective function is operating or the power supply stops, the motor enters the free run stop state. When an emergency stop is required or when the motor should be kept stopped, use of a mechanical brake should be considered.
High-frequency run	A max. 400Hz can be selected on the SJ700N Series. However, a two-pole motor can attain up to approx. 24,000 rpm, which is extremely dangerous. Therefore, carefully make selection and settings by checking the mechanical strength of the motor and connected machines. Consult the motor manufacturer when it is necessary to drive a standard (general-purpose) motor above 60 Hz. A full line of high-speed motors is available from Hitachi.

< Installation Location and Operating Environment >

Avoid installation in areas of high temperature, excessive humidity, or where moisture can easily collect, as well as areas that are dusty, subject to corrosive gasses, mist of liquid for grinding, or salt. Install the inverter away from direct sunlight in a well-ventilated room that is free of vibration. The inverter can be operated in the ambient temperature range of -10 to 50°C.

< Main Power Supply >

Installation of an AC reactor on the input side	<p>In the following examples involving a general-purpose inverter, a large peak current flows on the main power supply side, and is able to destroy the converter module. Where such situations are foreseen or the connected equipment must be highly reliable, install an AC reactor between the power supply and the inverter. Also, where influence of indirect lightning strike is possible, install a lightning conductor.</p> <p>(A) The unbalance factor of the power supply is 3% or higher. (Note) (B) The power supply capacity is at least 10 times greater than the inverter capacity (the power supply capacity is 500 kVA or more). (C) Abrupt power supply changes are expected. Examples: (1) Several inverters are interconnected with a short bus. (2) A thyristor converter and an inverter are interconnected with a short bus. (3) An installed phase advance capacitor opens and closes. In cases (A), (B) and (C), it is recommended to install an AC reactor on the main power supply side. Note: Example calculation with $V_{RS} = 205V$, $V_{ST} = 201V$, $V_{TR} = 200V$ V_{RS}: R-S line voltage, V_{ST}: S-T line voltage, V_{TR}: T-R line voltage</p> $\text{Unbalance factor of voltage} = \frac{\text{Max. line voltage (min.)} - \text{Mean line voltage}}{\text{Mean line voltage}} \times 100$ $= \frac{V_{RS} - (V_{RS} + V_{ST} + V_{TR})/3}{(V_{RS} + V_{ST} + V_{TR})/3} \times 100 = \frac{205 - 202}{202} \times 100 = 1.5 (\%)$
Using a private power generator	An inverter run by a private power generator may overheat the generator or suffer from a deformed output voltage waveform of the generator. Generally, the generator capacity should be five times that of the inverter (kVA) in a PWM control system, or six times greater in a PAM control system.

Notes on Peripheral Equipment Selection

Wiring connections		(1) Be sure to connect main power wires with R(L1), S(L2), and T(L3) terminals (input) and motor wires to U(T1), V(T2), and W(T3) terminals (output). (Incorrect connection will cause an immediate failure.) (2) Be sure to provide a grounding connection with the ground terminal ().
Wiring between inverter and motor	Electromagnetic contactor	When an electromagnetic contactor is installed between the inverter and the motor, do not perform on-off switching during running operation.
	Thermal relay	When used with standard applicable output motors (standard three-phase squirrel-cage four-pole motors), the SJ700N series does not need a thermal relay for motor protection due to the internal electronic protective circuit. A thermal relay, however, should be used: <ul style="list-style-type: none"> ● During continuous running outside a range of 30 to 60 Hz. ● For motors exceeding the range of electronic thermal adjustment (rated current). ● When several motors are driven by the same inverter; install a thermal relay for each motor. ● The RC value of the thermal relay should be more than 1.1 times the rated current of the motor. Where the wiring length is 10 m or more, the thermal relay tends to turn off readily. In this case, provide an AC reactor on the output side or use a current sensor.
Installing a circuit breaker		Install a circuit breaker on the main power input side to protect inverter wiring and ensure personal safety. Choose an inverter-compatible circuit breaker. The conventional type may malfunction due to harmonics from the inverter. For more information, consult the circuit breaker manufacturer.
Wiring distance		The wiring distance between the inverter and the remote operator panel should be 20 meters or less. Shielded cable should be used on the wiring. Beware of voltage drops on main circuit wires. (A large voltage drop reduces torque.)
Earth leakage relay		If the earth leakage relay (or earth leakage breaker) is used, it should have a sensitivity level of 15 mA or more (per inverter).
Phase advance capacitor		Do not use a capacitor for power factor improvement between the inverter and the motor because the high frequency components of the inverter output may overheat or damage the capacitor.

High-frequency Noise and Leakage Current

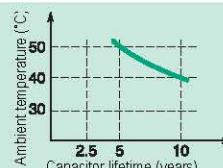

- (1) High-frequency components are included in the input/output of the inverter main circuit, and they may cause interference in a transmitter, radio, or sensor if used near the inverter. The interference can be minimized by attaching noise filters (option) in the inverter circuitry.
(2) The switching action of an inverter causes an increase in leakage current. Be sure to ground the inverter and the motor.

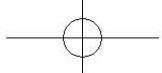

Lifetime of Primary Parts

Because a DC bus capacitor deteriorates as it undergoes internal chemical reaction, it should normally be replaced every 10 years. (10 years is not the guaranteed lifespan but rather, the expected design lifespan.) Be aware, however, that its life expectancy is considerably shorter when the inverter is subjected to such adverse factors as high temperatures or heavy loads exceeding the rated current of the inverter.

JEMA standard is the 10 years at ambient temperature 40°C used in 12 hours daily. (according to the "Instructions for Periodic Inspection of General-Purpose Inverter" (JEMA).)

Also, such moving parts as a cooling fan should be replaced. Maintenance inspection and parts replacement must be performed by only specified trained personnel. Please plan to replace new INV depends on the load, ambient condition in advance.
